Received 2 December 2009; accepted 13 May 2010

Key indicators: single-crystal X-ray study;  $T = 192\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.035;  $wR$  factor = 0.099; data-to-parameter ratio = 21.2.

The title compound,  $(\text{C}_{21}\text{H}_{33}\text{N}_2\text{O})_2[\text{SmCl}_5(\text{C}_4\text{H}_8\text{O})]\cdot\text{C}_7\text{H}_8\cdot\text{C}_4\text{H}_8\text{O}$ , has a layered structure in which each distorted octahedral  $[\text{SmCl}_5(\text{THF})]^{2-}$  unit (THF is tetrahydrofuran) is capped by two cations. The central metal  $\text{Sm}^{III}$  atom of the  $[\text{SmCl}_5(\text{THF})]^{2-}$  anionic unit is coordinated by five Cl atoms and one THF O atom, forming a distorted octahedral geometry. The crystal structure displays C—H $\cdots$ Cl and O—H $\cdots$ Cl hydrogen bonding. The structure exhibits disorder of the solvent.

**Comment**

Recently, the anionic functionalized N-heterocyclic carbenes (NHCs), such as amino- or phenoxy(alkoxo)-NHCs, have attracted much more attention particularly in the field of rare earth metals as the anionic tether can be used as anchor to enhance the bond of NHC to these electropositive metals (Arnold *et al.*, 2006; Liddle *et al.*, 2007). A series of anionic functionalized NHCs have been synthesized and structurally characterized (Arnold *et al.*, 2009; Wang *et al.*, 2006a). However, the reaction of ligands with cerium triiodide (Arnold *et al.*, 2005) or ytterbium trichloride (Wang *et al.*, 2006a) in the presence of organic base gives no desired product. Especially noteworthy is the cleavage reaction of the ligand that occurs during the reaction process (Wang *et al.*, 2006b). For a better understanding of the reason, the complex  $[NdCl_5(\text{THF})]^{2-}[\text{HO}-3,5\text{-di-}^t\text{Bu-C}_6\text{H}_2-2\text{-CH}_2\{\text{CH}(\text{NCHCHN}^i\text{Pr})\}]^{2+}$  (Yao *et al.*, 2007) has been studied. In order to further study these compounds, the title complex has been synthesized. Although the ion-pair structure has recently been reported for  $\text{LnI}_3$  in sulfonium-based ionic liquids (Babai *et al.*, 2005), its structural feature is different from that of the title complex. In  $[\text{SEt}_3]_3[\text{NdI}_6]$ ,  $\text{SEt}_3$  is a triethylsulfonium cation; an octahedron  $[\text{NdI}_6]^{3-}$  is capped by triethylsulfonium cations ( $\text{SEt}_3$ ) via the coordination of  $\text{Nd}^{3+}$  to  $\text{SEt}_3$ . The X-ray crystal analysis of the title complex indicates that the bis-[3,5-ditertbutyl-2-hydroxybenzyl]N-isopropylimidazolyl samarium pentachloride consists of an anion  $[\text{SmCl}_5(\text{THF})]^{2-}$  and two cations  $[\text{HO}-3,5\text{-di-}^t\text{Bu-C}_6\text{H}_2-2\text{-CH}_2\{\text{CH}(\text{iPrNCHCHN})\}]^{2+}$ . The central metal Sm in the anionic unit  $[\text{SmCl}_5(\text{THF})]^{2-}$  coordinates to five Cl atoms and one oxygen atom from a solvent THF molecule to form a six-coordinated distorted octahedron geometry, which is similar to the reported complex (Yao *et al.*, 2007). The four chlorines Cl(1), Cl(2), Cl(3) and Cl(4) can be considered to occupy the equatorial positions within the octahedron about the lanthanide center. The O(3) and Cl(5) occupy the two axial sites. The angle O(3)—Sm—Cl(5) is slightly distorted from the ideal value of  $180^\circ$  to  $174.99(8)^\circ$ . The Sm—Cl average bond lengths of  $2.6743\text{\AA}$  in the title complex are somewhat shorter than  $2.789(2)\text{\AA}$  and  $2.827\text{\AA}$  found in the complex  $[(\text{SiMe}_3)^2\text{NC}(\text{NC}_6\text{H}_{11})_2]\text{Sm}(\mu\text{-Cl})_2\text{Li}(\text{THF})_2$  (Yao *et al.*, 2004). The Sm—O(3) bond of  $2.452(3)\text{\AA}$  is comparable to  $2.448\text{\AA}$  found in the complex  $[\text{CH}_3\text{C}_5\text{H}_4]_2\text{Sm}[\text{SC}(\text{SPh})\text{NPh}](\text{THF})_2$  (Lu *et al.*, 2001). Especially noteworthy is the difference in the network of intermolecular and intramolecular hydrogen bonds. In the complex reported by Yao *et al.* (2007) the hydrogen bonds only exist between the O—H of phenol and Cl. However, in the title complex the hydrogen bonds not only exist in between the O—H of phenol and Cl, but also occur between C—H of imidazole ring, benzyl and isopropyl from the imidazolium ring.

**Experimental**

All manipulations were performed under pure argon with rigorous exclusion of air and moisture by using standard Schlenk techniques. THF was degassed and distilled from sodium benzophenone ketyl under argon prior to use. *N*-aryloxo imidazolium chloride  $[\text{HO}-3,5\text{-di-}^t\text{Bu-C}_6\text{H}_2-2\text{-CH}_2\{\text{CH}(\text{iPrNCHCHN})\}] \text{Cl}$  was prepared according to the literature (Li *et al.*, 2005).

## Refinement

H atoms were positioned geometrically (C—H = 0.95–1.00 Å) and included in the refinement in the riding-model approximation, with Uiso(H) = 1.2 or 1.5 times Ueq(C). The highest electron-density peak is 0.97 Å <sup>90</sup> from atom H24. The program SQUEEZE was used to handle the disordered THF and toluene molecules.

*Refinement*

Refinement on  $F^2$  Primary atom site location: structure-invariant direct methods  
 Least-squares matrix: full Secondary atom site location: difference Fourier map  
 $R[F^2 > 2\sigma(F^2)] = 0.035$  Hydrogen site location: inferred from neighbouring sites  
 $wR(F^2) = 0.099$  H-atom parameters constrained  
 $S = 1.09$   $w = 1/[\sigma^2(F_o^2) + (0.0499P)^2 + 1.7866P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 11687 reflections  $(\Delta/\sigma)_{\max} = 0.001$   
 550 parameters  $\Delta\rho_{\max} = 1.03 \text{ e \AA}^{-3}$   
 54 restraints  $\Delta\rho_{\min} = -0.51 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
