¹ Mean difference in plasma hemoglobin A1c comparing each of the four higher metabolite quintiles to the lowest (reference) quintile. The mean differences were obtained in cross-sectional analyses using Generalized Estimating Equations in models with serial metabolite and covariate measurements. The multivariable model adjusted for age, sex, race, site, education, income, BMI, waist, smoking, physical activity, systolic blood pressure, hypertension, LDL, CHD, animal sourced foods consumption, total energy intake. Abbreviations: TMAO = Trimethylamine-N-oxide.

¹ Mean difference in plasma glucose comparing each of the four higher metabolite quintiles to the lowest (reference) quintile. The mean differences were obtained in cross-sectional analyses using Generalized Estimating Equations in models with serial glucose, metabolite, and covariate measurements. The models were adjusted for age, sex, race, site, education, income, BMI, waist, smoking, physical activity, systolic blood pressure, hypertension, LDL, CHD, animal sourced foods consumption, total energy intake and eGFR, and stratified on sex.

Abbreviations: TMAO = Trimethylamine-N-oxide; eGFR= Estimated glomerular filtration rate.

¹ Hazard Ratios of incident diabetes comparing each of the four higher metabolite quintiles to the lowest (reference) quintile, obtained from Cox regression models with serial measures of metabolite and time-updated covariates. The Multivariable Model adjusted for age, sex, race, site, education, income, BMI, waist, smoking, physical activity, systolic blood pressure, hypertension, LDL, CHD, animal sourced foods consumption, total energy intake. The Multivariable Model with eGFR additionally adjusted for eGFR. Abbreviations: HR=Hazard ratio; TMAO = Trimethylamine-N-oxide; eGFR= Estimated glomerular filtration rate.

eTable 5. Tests of Interaction Between the Metabolites and Age, Sex, BMI, Coronary Heart Disease, eGFR, and Dietary Intake of Animal-Sourced Foods in the Analysis of Incident Type 2 Diabetes

Effect modifier →	Median age	Sex	Median BMI	Prevalent CHD	eGFR (60 or more vs <60)	Median consumption of animal sourced foods
TMAO	0.41	0.68	0.05	0.86	0.98	0.11
Choline	0.13	0.37	0.66	0.64	0.88	0.87
Betaine	0.71	0.04	0.003	0.43	0.03	0.29
Carnitine	0.37	0.41	0.17	0.52	0.72	0.06
γ-Butyrobetaine	0.45	0.53	0.61	0.77	0.81	0.74
Crotonobetaine	0.96	0.93	0.31	0.07	0.34	0.60

Each cell in the table corresponds to a separate Cox proportional-hazards regression analysis of incident type 2 diabetes that included the metabolite (linear variable), covariates and a multiplicative term between the metabolite (linear variable) and the effect modifier. Listed in the table are p-values for the multiplicative terms. The covariates included age, sex, race, site, education, income, BMI, waist, smoking, physical activity, systolic blood pressure, hypertension, LDL, CHD, animal sourced foods consumption and total energy intake. The pre-specified threshold of significance for these interaction tests was 0.0014 (0.05/36 tests).
