Received 12 July 2011; accepted 15 July 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.054;  $wR$  factor = 0.175; data-to-parameter ratio = 32.4.

The title molecule,  $\text{C}_{14}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_4\text{S}_2$ , lies on an inversion center. The molecule is twisted in the region of the sulfonamide group with a  $\text{C}-\text{S}-\text{N}-\text{C}$  torsion angle of  $-67.49(16)^\circ$ . In the crystal, molecules are connected via intermolecular  $\text{N}-\text{H}\cdots\text{O}$  and weak  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, forming layers parallel to (100).

### Related literature

### ***N,N'*-(Ethane-1,2-diyl)bis(4-chlorobenzenesulfonamide)**

**M. T. M. Al-Dajani, H. A. Wahab, S. Shamsuddin, M. Hemamalini and H.-K. Fun**

#### **Comment**

The chemistry of sulfonamides is of interest as they show distinct physical, chemical and biological properties. Many aryl-sulfonamides and their *N*-halo compounds exhibit pharmacological, fungicidal and herbicidal activities due to their oxidizing action in aqueous, partial aqueous and non-aqueous media. 2-chlorobenzenesulfonamide has been used to explore the substituent effects on the solid state structures of sulfonamides and *N*-haloarylsulfonamides (Gowda *et al.*, 2003, 2007). The crystal structures of 4-aminobenzenesulfonamide (O'Connor & Maslen, 1965) and 4-methylbenzenesulfonamide (Kumar *et al.*, 1992) have been reported in the literature. In this paper, we present the X-ray single-crystal structure of *N,N'*-(ethane-1,2-diyl)bis(4-chlorobenzenesulfonamide) (I).

The asymmetric unit of the title compound, (I), consists of a half molecule of *N,N'*-(ethane-1,2-diyl)bis(4-chlorobenzenesulfonamide). The other half is generated by a crystallographic inversion center, as shown in Fig. 1. The molecule is twisted at the S atom with an C-S-N-C torsion angle of -67.49 (16) $^{\circ}$ . This value agrees with that previously reported for the crystal structure of 4-Chloro-*N*-(2,6-dimethylphenyl)benzene sulfonamide (Shakuntala *et al.*, 2011). In the crystal, molecules are connected *via* N1—H1N1 $\cdots$ O2<sup>ii</sup> and C4—H4A $\cdots$ O1<sup>iii</sup> (Table 1) hydrogen bonds (Fig. 2) forming layers parallel to (100).

#### **Experimental**

In a round bottom flask, 25ml of toluene was mixed with 4-chlorobenzenesulfonyl chloride (0.02 mol, 3.5 g) with stirring. Drops of ethylenediamine (0.01mol, 0.5 g ) were added and the mixture was refluxed for 30 min. The yellow gum formed was dissolved in hot water and sodium bicarbonate was added. The yellow precipitate formed was dissolved in methanol at 333K, yielding colourless crystals.

#### **Refinement**

Atom H1N1 was located from a difference Fourier maps and refined freely [N—H = 0.78 (3) Å]. The remaining H atoms were positioned geometrically [C—H = 0.93–0.97 Å] and were refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ .

#### **Figures**

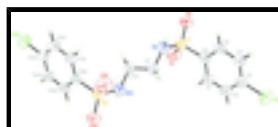

Fig. 1. The molecular structure of the title compound showing 50% probability displacement ellipsoids (symmetry code: (A) -x+1, -y+2, -z).

M <sub>r</sub> = 409.29	D <sub>x</sub> = 1.553 Mg m <sup>-3</sup>
Monoclinic, P2 <sub>1</sub> /c	Mo K $\alpha$ radiation, $\lambda$ = 0.71073 Å
Hall symbol: -P 2ybc	Cell parameters from 9471 reflections
a = 13.2640 (5) Å	$\theta$ = 3.3–33.5°
b = 5.3390 (2) Å	$\mu$ = 0.63 mm <sup>-1</sup>
c = 13.1792 (5) Å	T = 296 K
$\beta$ = 110.270 (1)°	Plate, colourless
V = 875.51 (6) Å <sup>3</sup>	0.86 × 0.42 × 0.13 mm
Z = 2	

### Data collection

Bruker APEXII DUO CCD area-detector diffractometer	3689 independent reflections
Radiation source: fine-focus sealed tube graphite	2869 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.032$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2009)	$\theta_{\max} = 34.5^\circ$ , $\theta_{\min} = 3.1^\circ$
$T_{\min} = 0.613$ , $T_{\max} = 0.925$	$h = -21 \rightarrow 21$
25142 measured reflections	$k = -8 \rightarrow 8$
	$l = -19 \rightarrow 20$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.054$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.175$	$w = 1/[\sigma^2(F_o^2) + (0.0979P)^2 + 0.221P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\max} < 0.001$
3689 reflections	$\Delta\rho_{\max} = 0.84 \text{ e } \text{\AA}^{-3}$
114 parameters	$\Delta\rho_{\min} = -0.71 \text{ e } \text{\AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXTL</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$

Primary atom site location: structure-invariant direct methods Extinction coefficient: 0.037 (6)

### *Special details*

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
