#### Abstract

The reactions of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in a $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ or 2- $\mathrm{PrOH} / \mathrm{H}_{2} \mathrm{O}$ medium in the presence of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ afforded 6-alkoxy-2-amino-4-ferrocenylpyridine-3,5-dicarbonitriles 3a,b (multi-component condensation) and 6-alkoxy-2-amino-4-ferrocenyl-3-ferrocenylmethyl-3,4-dihydropyridine-3,5-dicarbonitriles $\mathbf{4 a , b}$ (multi-component cyclodimerization). Analogous reactions of $\mathbf{1}$ with $\mathbf{2}$ in an $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ medium in the presence of NaOH , piperidine, or morpholine gave compounds 3a, 4a and 2-amino-4-ferrocenyl-6-hydroxy-, 6-piperidino- and 6-morpholinopyridine-3,5dicarbonitriles $\mathbf{3 c} \mathbf{c} \mathbf{e}$, respectively. The structures of the compounds $\mathbf{3 b}, \mathbf{4 a}$ and $\mathbf{4 b}$ were established by the spectroscopic data and X-ray diffraction analysis. The electrochemical behaviour of compounds $\mathbf{3 b}, \mathbf{3 d}$ and $\mathbf{4 b}$ was investigated by means of cyclic voltammetry.

Keywords: ferrocene; 2-cyano-3-ferrocenylacrylonitrile; malononitrile; X-ray diffraction; amino(ferrocenyl)pyridine-3,5-dicarbonitriles; cyclic voltammetry

## 1. Introduction

Pyridine derivatives have been studied for over a century as an important class of heterocyclic compounds and they still continue to attract considerable attention due to the wide range of medicinal properties they possess, such as vasodilators, anticoagulants, hypolipidemic, tuberculostatic, antihistamine, antihypertensive, cardiovascular and gastrointestinal activities [1,2]. Pyridine systems are also found in important vitamins (PP, $\mathrm{B}_{6}$ ), alkaloids and herbicides [1].

The incorporation of one or two iron-containing ferrocene substituents into a pyridine molecule will enlarge the spectrum of valuable characteristics. In addition, ferrocene compounds are known to exhibit chemotherapeutic properties [3]. Ferrocenyl-substituted pyridines have been extensively studied as ligands, in the synthesis of non-linear optical materials, etc. [4-6]. However, their biological activities have not hitherto been studied. Various methods to prepare ferroceno-containing pyridines have been reported [7-10]. Syntheses of ferrocenylpyridines are mainly carried out via Negishi cross-coupling reactions of FcZnCl with bromopyridines [7], the condensations of 1,3-diketones with ferrocenecarboxaldehyde in the presence of $\mathrm{AcONH}_{4}$ [8]; the interactions of ferrocenyl-1,2-enones with 3-aminocrotononitrile [9], ethyl 3-aminocrotonate [9] or acetonitrile in the presence of $\mathrm{Me}_{3} \mathrm{COK}$ [10]. The interest in heterocyclic compounds bearing ferrocenyl substituents in the molecules can be traced back to the discovery of ferrocene [11-14]. This is determined by a peculiar chemical behavior of such compounds due to mutual influence of the metallocene and heterocyclic moieties. In particular, biological activities of many nitrogen heterocycles, such as quinuclidines, pyrazolines, pyrazoles, pyrimidines, tetrahydropyridazines, bearing ferrocenyl substituents, have been reported [8,15-20]. It may be expected that ferrocenylpyridines and cyano(ferrocenyl)pyridines will also prove valuable, because they possess diverse biological activity, find use as potential bio-receptor ligands [13-15], new drugs [16-20], and significant intermediates for the synthesis of important materials [21-23]. For these reasons, development of new compounds containing cyano and ferrocenyl groups in the pyridines is strongly desired.

Herein we report results from our investigations into reactions of the condensation of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) and of the tandem-transformations of $\mathbf{1}$ in alcohols/aqueous medium in the presence of bases and nucleophiles. The electrochemical behavior of the 6-alkoxy-2-amino-4-ferrocenylpyridine-3,5-dicarbonitriles and 6-alkoxy-2-amino-4-ferrocenyl-3-ferrocenylmethyl-3,4-dihydropyridine-3,5-dicarbonitriles was studied.

## 2. Results and Discussion

2.1. Synthesis of 6-Alkoxy-2-amino-4-ferrocenylpyridine-3,5-dicarbonitriles and 6-alkoxy-2-amino-4-ferrocenyl-3-ferrocenylmethyl-3,4-dihydropyridine-3,5-dicarbonitriles

We found that two competitive processes occur upon reaction of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ or $2-\mathrm{PrOH} / \mathrm{H}_{2} \mathrm{O}$ medium in the presence of $\mathrm{Na}_{2} \mathrm{CO}_{3}$, $v i z$, formation of 6-alkoxy-2-amino-4-ferrocenylpyridine-3,5-dicarbonitriles 3a,b (multi-component condensation) and of cyclodimeric products $\mathbf{4 a , b}$ (multi-component cyclodimerization). In addition, other minor reaction products of the starting compounds were also isolated, however their structures
could not be established from their ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectroscopy and mass spectrometry data (Scheme 1).

\end{aligned}
$$

The compounds $\mathbf{3 a}, \mathbf{b}$ and $\mathbf{4 a}, \mathbf{b}$ were isolated by column chromatography on alumina and their structures were characterized by IR and NMR spectroscopy, mass spectrometry, and elemental analysis (see Experimental section). According to the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data, the cyclodimerization of 1 occurs with high diastereoselectivity, and compounds $4 \mathbf{a}$ and $\mathbf{4 b}$ were isolated as a single diastereomeric form. One cannot rule out the formation of minor diastereomeric products; however they could not be isolated and characterized.

The molecular structures of compounds $\mathbf{3 b}, \mathbf{4 a}$ and $\mathbf{4 b}$ were determined by X-ray diffraction analysis of their single crystals. The general views of molecules $\mathbf{3 b}, \mathbf{4 a}$, and $\mathbf{4 b}$ are shown in Figures 1-3, respectively, while the principal geometric parameters are listed in Table 1.

Figure 1. Crystal structure of $\mathbf{3 b}$.

Figure 2. Crystal structure of $\mathbf{4 a}$.

Figure 3. Crystal structure of $\mathbf{4 b}$.

X-Ray diffraction analysis confirmed the aromatic ferrocenylpyridine structure for compound $\mathbf{3 b}$, and diferrocenyl(dihydro)pyridine structures for compounds $\mathbf{4 a}$ and $\mathbf{4 b}$. Central fragment of the molecule $\mathbf{3 b}$ is a flat six-membered ring with one nitrogen atom. The $\mathrm{N}(1)-\mathrm{C}(14)$ bond length in the compound $\mathbf{3 b}$ is somewhat shorter [ $d=1.318(2) \AA$ ] compared to the standard length (cf. $d=1.338 \AA$ [24]). The bond lengths of the $\mathrm{C}-\mathrm{Fe}$ and $\mathrm{C}-\mathrm{C}$ bonds in the ferrocenyl substituents as well as the geometric parameters of the ferrocene sandwiches are close to standard values [25].

|  |  |  |  |

Key elements of the molecules $\mathbf{4 a}$ and $\mathbf{4 b}$ are the central six-membered ring with one nitrogen atom in the half-chair conformation. The $\mathrm{N}(1)-\mathrm{C}(23)$ (for $\mathbf{4 a}$ ) and $\mathrm{N}(1)-\mathrm{C}(26)$ (for $\mathbf{4 b}$ ) bond lengths are equal to $d=1.319(3) \AA$, and $d=1.291(4) \AA$, respectively. The ferrocenyl and ferrocenylmethyl substituents at C-4 and C-5 of $\mathbf{4 a}$ and $\mathbf{4 b}$ are trans oriented relative to the 6-membered cycle.

We found further that 2-cyano-3-ferrocenylacrylonitrile (1) reacted analogously with malononitrile (2) in $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ medium in the presence of NaOH , piperidine or morpholine to give compounds 3a,c-e and $\mathbf{4 a}$ (Schemes 2 and 3). Cyclodimeric products $\mathbf{4 c}, \mathbf{d}, \mathbf{e}$ with hydroxy-, piperidino- or morpholino-substituents
were not detected (Schemes 2 and 3). As in the case of reaction of $\mathbf{1}$ with $\mathbf{2}$ in the presence $\mathrm{Na}_{2} \mathrm{CO}_{3}$, the polymerization products of the starting compounds were also present in minor quantities.

Scheme 2. Reaction of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in the presence of NaOH .

Scheme 3. Reaction of 2-cyano-3-ferrocenyl-acrylonitrile (1) with malononitrile (2) in the presence of piperidine or morpholine.

Both reaction mixtures were separated by column chromatography on alumina, and the structures of the isolated products were characterized by IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectroscopy, mass spectrometry, and elemental analysis. These physicochemical characterizations of compounds $\mathbf{3 c}$ - e corroborate completely their structures.

The formation of 2-amino-4-ferrocenylpyridine-3,5-dicarbonitriles 3a-e in the presence of bases and nucleophiles proceeds, in our opinion, via multi-component condensation reaction [26] (Scheme 4). Possibly the intermediate $\mathbf{5}$ is generated in one step and then transformed into pyridines 3a-e.

Scheme 4. Possible mechanism for the formation of compounds 3a-e.

A tentative mechanism for the formation of the diferrocenyl(dihydro)pyridine-3,5-dicarbonitriles $\mathbf{4 a}, \mathbf{b}$ is represented in Scheme 5.

Scheme 5. Possible mechanism for the formation of compounds $\mathbf{4 a}, \mathbf{b}$.

To verify the mechanism described in Scheme 5 above, the cyclodimerization of 2-cyano-3ferrocenylacrylonitrile (1) was carried out under identical conditions in 2-propanol in the presence of water and $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The product of the cyclodimerization, 2-amino-4-ferrocenyl-3-ferrocenylmethyl-6-isopropoxy-3,4-dihydropyridine-3,5-dicarbonitrile (4b), was obtained with $\sim 27 \%$ yield. Thus, cyclodimerization of compound 1 represents a novel type of the three-component anomalous reaction of [4+2]-cycloadition, absolutely different from the Diels-Alder reaction.

### 2.2. Electrochemistry

Figure 4 shows a typical voltammogram of compound $\mathbf{3 b}$ recorded from open circuit potential to positive direction using a platinum electrode. It was observed one oxidation signal $\mathbf{I}_{\mathbf{a}}$ with anodic peak potential value $E_{\mathrm{pa}}\left(\mathbf{I}_{\mathbf{a}}\right)=0.247 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$and, one reduction signal $\mathbf{I}_{\mathbf{c}}$, with cathodic peak potential value $E_{\mathrm{pc}}\left(\mathbf{I}_{\mathbf{c}}\right)=0.184 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$. The $\Delta E \mathrm{p}=0.063$ was independent of scan rate (from 0.1 to $1 \mathrm{~V} \cdot \mathrm{~s}^{-1}$ ). The cathodic peak current and the anodic peak current were proportional to $v^{1 / 2}$, indicating that $\mathbf{I}$ is a diffusion-controlled process [27]. The evidence presented above suggests that process I can be attributed to the reversible electron transfer for the ferrocene moiety $\mathrm{Fc}-\mathrm{Fc}^{+}$. The formal potential electrode value was $\mathrm{E}^{0^{\prime}}=0.215 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$, estimated as $\mathrm{E}^{0^{\prime}}=1 / 2\left(\mathrm{E}_{\mathrm{pa}}+\mathrm{E}_{\mathrm{pc}}\right)$. The electrochemical behaviour of compound 3d is very similar to that observed for 3b. There are slight changes in peak potential values: $E_{\mathrm{pa}}\left(\mathbf{I}_{\mathbf{a}}\right)=0.241 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}, E_{\mathrm{pc}}\left(\mathbf{I}_{\mathbf{c}}\right)=0.174 \mathrm{~V} / \mathrm{Fc}^{2}-\mathrm{Fc}^{+}, \Delta E \mathrm{p}=0.067 \mathrm{~V}$ and $\mathrm{E}^{0^{\prime}}=0.207 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$.

Figure 5 shows a cyclic voltammogram of compound $\mathbf{4 b}$. When the scan was started from open circuit potential to positive direction two oxidation signals $\left(\mathbf{I}_{\mathbf{a}}\right)$ and $\left(\mathbf{I I}_{\mathbf{a}}\right)$ were observed. The anodic peak potentials values for these signals are $E_{\mathrm{pa}}\left(\mathbf{I}_{\mathrm{a}}\right)=0.198 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$and $E_{\mathrm{pa}}\left(\mathbf{I I}_{\mathrm{a}}\right)=1.149 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$. When the cycle was complete only one reduction signal $\mathbf{I}_{\mathrm{c}}$ (related to the oxidation process $\mathbf{I}_{\mathrm{a}}$ ) was observed. The estimated cathodic peak potential value was $E_{\mathrm{pc}}\left(\mathbf{I}_{\mathrm{c}}\right)=0.099 \mathrm{~V} / \mathrm{Fc}_{\mathrm{c}}-\mathrm{Fc}^{+}$. Despite the use of different scan rates $\left(0.1 \mathrm{~V} \cdot \mathrm{~s}^{-1}-1.0 \mathrm{~V} \cdot \mathrm{~s}^{-1}\right)$ in the voltammetric experiments, the product of the
electrochemical reduction in the process IIa was not detected. This result points out the absence of electronic communication between the two proximal ferrocenyl centres, which is contrary to the observations reported recently [28], where the communication between ferrocenyl fragments was detected in 3,5 -diferrocenylpyridine. The electrochemical process I is attributed to the ferrocene moiety at the para position to the nitrogen atom of the heterocycle, $\mathrm{Fc}_{\text {para }}{ }^{-} / \mathrm{Fc}_{\text {para }}{ }^{+}$. The estimated formal potential electrode value was $\mathrm{E}^{0^{\prime}}=0.1485 \mathrm{~V} / \mathrm{Fc}-\mathrm{Fc}^{+}$.

Figure 4. Cyclic voltammogram of compound $\mathbf{3 b}$ in the presence of $0.1 \mathrm{M} \mathrm{TBABF}_{4}$ in MeCN . Scan rate $0.1 \mathrm{~V} \cdot \mathrm{~s}^{-1}$. The working electrode used was platinum.

Figure 5. Cyclic voltammogram of compound $\mathbf{4 b}$ in the presence of 0.1 M TBABF 4 in MeCN . The scan rate $0.10 \mathrm{~V} \cdot \mathrm{~s}^{-1}$. The working electrode used was platinum.

The second oxidation process (IIa) is related to the ferrocene moiety at the meta position to the nitrogen atom of the heterocycle $\left(\mathrm{Fc}_{\text {meta }} / \mathrm{Fc}_{\text {meta }}{ }^{+}\right)$with high positive electronic density due to its proximity to the CN group. The absence of the reduction signal in the process II could be attributed to
a low stabilization of the electro-generated dication $\left(\mathrm{Fc}^{+}\right.$para $\left.-\mathrm{Fc}_{\text {meta }}{ }^{+}\right)$by the solvent $[29,30]$. This fact was confirmed when the experiment was performed in a coordinative solvent such as DMSO, where electrochemical response becomes more irreversible.

## 3. Experimental

### 3.1. General

All the solvents were dried according to the standard procedures and were freshly distilled before use [31]. Column chromatography was carried out on alumina (Brockmann activity III). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on a Unity Inova Varian spectrometer ( 300 and 75 MHz , Palo Alto, CA, USA) for solutions in $\mathrm{CDCl}_{3}$, with $\mathrm{Me}_{4} \mathrm{Si}$ as the internal standard. The IR spectra were measured on a Spectrophotometer FT-IR (Spectrum RXI Perkin Elmer instruments, Waltham, MA, USA) using KBr pellets. The mass spectra were obtained on a Varian MAT CH-6 instrument (EI MS, 70 eV ). Elementar Analysensysteme LECO CHNS-900 (St. Joseph, MI, USA) was used for elemental analysis.

The electrochemical behavior of compounds $\mathbf{3 b}, \mathbf{3 d}$ and $\mathbf{4 b}$ was explored with a Biologic SP-50 (Grenoble, France) potentiostat/galvanostat. The current interrupt method was used for $i R$ compensation during all the experiments. The sample concentration employed was ca. 1 mM in acetonitrile in the presence of 0.1 M tetra- N -butylammonium tetrafluoroborate $\left(\mathrm{TBABF}_{4}\right)$. A platinum disk and a platinum wire were used as working electrode and counter-electrode, respectively. A silver wire was used as a pseudo reference electrode. All solutions were bubbled with nitrogen 5 minutes prior each measurement. Cyclic voltammetry experiments were initiated from open circuit potential ( $\mathrm{E}_{\text {ocp }}$ ) to positive direction, using scan rates from 0.1 to $1.0 \mathrm{~V} \cdot \mathrm{~s}^{-1}$. All potentials were reported versus the couple $\mathrm{Fc} / \mathrm{Fc}^{+}$according to IUPAC convention [32]. The following reagents were purchased from Aldrich (Toluca, Mexico): ferrocenecarboxaldehyde, $99 \%$; malononitrile, $99 \%$; methyl alcohol, $99.9 \%$; 2-propanol, $99.9 \%$; morpholine, $99+\%$; piperidine, $99 \%$. 2-Cyano-3-ferrocenylacrylonitrile (1) was prepared by condensation of ferrocenecarbaldehyde with malononitrile in benzene in the presence of piperidinium acetate [33]. The physical and ${ }^{1} \mathrm{H}$-NMR spectroscopic characteristics of compound 1 were in accordance with the literature data [34].

Reactions of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in the presence of $\mathrm{Na}_{2} \mathrm{CO}_{3}$. A mixture of compound $\mathbf{1}(1.13 \mathrm{~g}, 5.0 \mathrm{mmol})$, malononitrile $2(0.4 \mathrm{~g}, 6.0 \mathrm{mmol})$, methanol or 2-propanol ( 100 mL ), $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(0.5 \mathrm{~g}, 5.0 \mathrm{mmol})$ was stirred and refluxed for 8 h . The solvents were removed in vacuo and the residue was dissolved in dichloromethane ( 50 mL ). The solution was mixed with $\mathrm{Al}_{2} \mathrm{O}_{3}$ (activity III, 20 g ) and the solvent was evaporated in air. This sorbent was applied onto a column with $\mathrm{Al}_{2} \mathrm{O}_{3}$ (the height of alumina is $c a .20 \mathrm{~cm}$ ) and the reaction products were eluted from the column first with petroleum ether, then with a $2: 1$ hexane-dichloromethane to give compounds $\mathbf{3 a}, \mathbf{b}, \mathbf{4 a}, \mathbf{b}$ and polymeric compounds.

2-Amino-4-ferrocenyl-6-methoxypyridine-3,5-dicarbonitrile (3a). Red crystals, yield 0.93 g (52\%), m.p. $162-163{ }^{\circ} \mathrm{C}$; IR (KBr): 425, 497, 509, 575, 812, 843, 911, 1004, 1044, 1107, 1185, 1223, 1259, $1295,1321,1340,1386,1424,1468,1482,1541,1557,1613,2212,2216,2321,2982,3101,3226$, 3372, $3462 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}: 4.00\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 4.28\left(\mathrm{~s}, 5 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.59\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.21(\mathrm{~m}, 2 \mathrm{H}$,

2-Amino-4-ferrocenyl-3-ferrocenylmethyl-6-isopropoxy-3,4-dihydropyridine-3,5-dicarbonitrile (4b).
Yellow crystals, yield $0.29 \mathrm{~g}(19 \%)$, m.p. dec. ca. $302^{\circ} \mathrm{C}$; IR ( KBr ): 483, 553, 682, 721, 783, 821, 915, 1001, 1026, 1042, 1106, 1142, 1181, 1249, 1294, 1316, 1355, 1371, 1383, 1423, 1475, 1544, 1585, 1629, 2191, 2300, 2930, 2978, 3095, 3241, 3335, $3466 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}: 1.39\left(\mathrm{~d}, 6 \mathrm{H}, 2 \mathrm{CH}_{3}\right.$, $J=6.0 \mathrm{~Hz}), 2.90\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}_{2}, J=13.8 \mathrm{~Hz}\right), 3.09\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}_{2}, J=13.8 \mathrm{~Hz}\right), 3.81(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 4.13(\mathrm{~s}$, $\left.5 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.28\left(\mathrm{~s}, 5 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.08\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 4.16\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 4.23\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 4.28(\mathrm{~m}$, $\left.2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 4.42\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.07(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}, J=6.0 \mathrm{~Hz}), 5.54\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}: 21.94$ $\left(2 \mathrm{CH}_{3}\right), 36.96\left(\mathrm{CH}_{2}\right), 41.40,66.96(2 \mathrm{CH}), 69.04,69.56\left(2 \mathrm{C}_{5} \mathrm{H}_{5}\right), 68.20,68.54,68.90,68.94,69.09$, 69.84, 70.38, $71.52\left(2 \mathrm{C}_{5} \mathrm{H}_{4}\right), 79.25,83.68\left(2 \mathrm{C}_{i p s o} \mathrm{Fc}\right), 119.16,120.49(2 \mathrm{CN}), 51.28,160.43,165.37$, 166.82 (4C); MS: $m / z 586[\mathrm{M}]^{+}$. Anal. Calcd. for $\mathrm{C}_{31} \mathrm{H}_{30} \mathrm{Fe}_{2} \mathrm{~N}_{4} \mathrm{O}:$ C 63.51 , H 5.16, Fe 19.05, N 9.55 . Found C 63.67, H 5.03, Fe 19.13, N 9.41.

Reaction of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in the presence of NaOH . The reaction of compound $\mathbf{1}(1.13 \mathrm{~g}, 5.0 \mathrm{mmol})$ with malononitrile $\mathbf{2}(0.4 \mathrm{~g}, 6.0 \mathrm{mmol})$ and 0.4 g NaOH in methanol $(100 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ was carried out under conditions described above; subsequent chromatography afforded $\mathbf{3 a}(15 \%), \mathbf{3 c}$ and $\mathbf{4 a}(12 \%)$.

2-Amino-4-ferrocenyl-6-hydroxypyridine-3,5-dicarbonitrile (3c). Red crystals, yield $0.98 \mathrm{~g}(57 \%)$, m.p. $146-147^{\circ} \mathrm{C}$; IR (KBr): 423, 495, 508, 580, 814, 839, 910, 1004, 1042, 1103, 1181, 1242, 1290,

1321, 1340, 1378, 1420, 1468, 1481, 1540, 1554, 1612 2211, 2221, 2327, 2985, 3109, 3219, 3371, $3489,3670 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}: 4.27\left(\mathrm{~s}, 5 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.58\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.21\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.60(\mathrm{bs}, 2 \mathrm{H}$, $\left.\mathrm{NH}_{2}\right), 5.73$ (bs, $\left.1 \mathrm{H}, \mathrm{OH}\right) ;{ }^{13} \mathrm{C}$-NMR: $71.05\left(\mathrm{C}_{5} \mathrm{H}_{5}\right), 70.54,71.22\left(\mathrm{C}_{5} \mathrm{H}_{4}\right), 82.50\left(\mathrm{C}_{i p s o} \mathrm{Fc}\right), 116.31$, 117.61 (2CN), 157.70, 160.26, 160.82, 161.52, 167.58 (5C); MS: m/z 344 [M] ${ }^{+}$. Anal. Calcd. for $\mathrm{C}_{17} \mathrm{H}_{12} \mathrm{FeN}_{4} \mathrm{O}: \mathrm{C} 59.33$, H 3.52, Fe 16.23, N 16.27. Found: C 59.24, H 3.47, Fe 16.09, N 16.18.

Reactions of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in the presence of amines. A solution of compounds $\mathbf{1}(5.0 \mathrm{mmol})$ and $2(6.0 \mathrm{mmol})$, piperidine or morpholine ( 2.0 mL ) in methanol ( 100 mL ) was stirred for 6 h at $60^{\circ} \mathrm{C}$. The reaction mixture was evaporated in vacuo, and the residue was subjected to TLC on $\mathrm{SiO}_{2}$ (hexane-dichloromethane, 2:1) to give compounds $\mathbf{3 a}(\sim 20 \%$, $R f=0.78), \mathbf{4 a}(\sim 9 \%, R f=0.67)$ and $\mathbf{3 d}, \mathbf{e}(58-61 \%, R f=0.35-0.54)$.

2-Amino-4-ferrocenyl-6-piperidinopyridine-3,5-dicarbonitrile (3d). Red crystals, yield 1.25 g (61\%), m.p. $182-183{ }^{\circ} \mathrm{C}$; IR (KBr): 416, 481, 503, 585, 814, 912, 1001, 1019, 1100, 1177, 1251, 1289, 1311, $1343,1392,1425,1464,1472,1546,1553,1612,2217,2226,2334,2973,3101,3239,3388,3469 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$-NMR: $1.70\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.83\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2}\right), 3.18\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2}\right), 4.32\left(\mathrm{~s}, 5 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.56(\mathrm{~m}$, $\left.2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.05\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.34\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) ;{ }^{13} \mathrm{C}-\mathrm{NMR}: 24.55\left(\mathrm{CH}_{2}\right), 26.05\left(2 \mathrm{CH}_{2}\right), 49.83$ $\left(2 \mathrm{CH}_{2}\right), 70.86\left(\mathrm{C}_{5} \mathrm{H}_{5}\right), 70.66,70.90\left(\mathrm{C}_{5} \mathrm{H}_{4}\right), 83.00\left(\mathrm{C}_{i p s o} \mathrm{Fc}\right), 118.52,119.29(2 \mathrm{CN}), 160.51(2 \mathrm{C}), 155.51$, 160.74, 163.32 (3C); MS: $m / z 411$ [M] ${ }^{+}$. Anal. Calcd. for $\mathrm{C}_{22} \mathrm{H}_{21} \mathrm{FeN}_{5}$ : C 64.25, H 5.15, Fe 13.58, N 17.02. Found: C 64.33, H 5.07, Fe 13.61, N 16.89.

2-Amino-4-ferrocenyl-6-morpholinopyridine-3,5-dicarbonitrile (3e). Red crystals, yield $1.20 \mathrm{~g}(58 \%)$, m.p. $190-192{ }^{\circ} \mathrm{C}$; IR (KBr): 432, 491, 512, 591, 815, 861, 908, 1002, 1041, 1101, 1120, 1215, 1251, $1299,1312,1340,1396,1442,1470,1510,1567,1621,1692,2212,2227,2989,3138,3278,3363$, $3476 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$-NMR: $3.26\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2}\right), 3.80\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2}\right), 4.37\left(\mathrm{~s}, 5 \mathrm{H}_{2} \mathrm{C}_{5} \mathrm{H}_{5}\right), 4.68(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{C}_{5} \mathrm{H}_{4}\right), 5.01\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{5} \mathrm{H}_{4}\right), 5.65\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) ;{ }^{13} \mathrm{C}-\mathrm{NMR}: 47.09\left(2 \mathrm{CH}_{2}\right), 50.98\left(2 \mathrm{CH}_{2}\right), 70.99\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)$, 67.17, $70.66\left(\mathrm{C}_{5} \mathrm{H}_{4}\right), 80.35\left(\mathrm{C}_{i p s o} \mathrm{Fc}\right), 116.03,118.31(2 \mathrm{CN}), 157.68(2 \mathrm{C}), 155.25,161.21 .168 .65(3 \mathrm{C})$; MS: $m / z 413[\mathrm{M}]^{+}$. Anal. Calcd. for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{FeN}_{5} \mathrm{O}$ : C 61.04, H 4.63, Fe 13.52, N 16.94. Found: C 60.94, H 4.48, Fe 13.44, N 17.08.

Chemical transformations of 2-cyano-3-ferrocenylacrylonitrile (1) in the presence of 2-PrOH, $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}$. A mixture of compound $1(1.13 \mathrm{~g}, 5.0 \mathrm{mmol})$, 2-propanol $(60 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(1.0 \mathrm{~g}, 10 \mathrm{mmol})$ was stirred for 12 h at $80^{\circ} \mathrm{C}$. The reaction mixture was worked up as described above, subsequent chromatography on $\mathrm{Al}_{2} \mathrm{O}_{3}$ gave compounds $\mathbf{3 b}(25 \%)$ and $\mathbf{4 b}(27 \%)$, respectively, and polimeric compounds.

### 3.2. Crystal Structures of $\mathbf{3 b}, \mathbf{4 a}$ and $\mathbf{4 b}$

Single crystals of $\mathbf{3 b}$ and $\mathbf{4 b}$ were obtained by crystallization from chloroform, while crystals of $\mathbf{4 a}$ were obtained by crystallization from methanol. The unit cell parameters and the X-ray diffraction intensities were recorded on a Gemini (detector Atlas CCD, Cryojet $\mathrm{N}_{2}$, Loveland, CO, USA) diffractometer. The structures of compounds $\mathbf{3 b}, \mathbf{4} \mathbf{a}$ and $\mathbf{4 b}$ were solved by the direct method (SHELXS-97 [35]) and refined using full-matrix least-squares on $\mathrm{F}^{2}$.

Crystal data for $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{FeN}_{4} \mathrm{O}$ (3b): $\mathrm{M}=386.23 \mathrm{~g} \cdot \mathrm{~mol}^{-1}$, orthorhombic P bca, $a=12.4557(8)$, $b=14.9714(6), c=18.4217(7) \AA, \alpha=90, \beta=90, \gamma=90^{\circ}, V=3435.3(3) \AA^{3}, \mathrm{~T}=130(2) \mathrm{K}, \mathrm{Z}=8$, $\rho=1.494 \mathrm{Mg} / \mathrm{m}^{3}$, wavelength $1.71073 \AA, \mathrm{~F}(000)=1,600$, absorption coefficient $0.895 \mathrm{~mm}^{-1}$, index ranges $-15 \leq \mathrm{h} \leq 15,-18 \leq \mathrm{k} \leq 17,-23 \leq 1 \leq 23$, scan range $3.54 \leq \theta \leq 26.73^{\circ}, 3633$ independent reflections, $\mathrm{R}_{\text {int }}=0.0326,26385$ total reflections, 243 refinable parameters, final R indices $[\mathrm{I}>2 \sigma(\mathrm{I})$ ] $\mathrm{R}_{1}=0.0301, \mathrm{wR}_{2}=0.0705, \mathrm{R}$ indices (all data) $\mathrm{R}_{1}=0.0398, \mathrm{wR}_{2}=0.0775$, goodness-of-fit on $\mathrm{F}^{2}$ 1.074, largest difference peak and hole $0.555 /-0.310 \mathrm{e}^{-3}$.

Crystal data for $\mathrm{C}_{31} \mathrm{H}_{30} \mathrm{Fe}_{2} \mathrm{~N}_{4} \mathrm{O}(\mathbf{4 b}): \mathrm{M}=586.29 \mathrm{~g} \cdot \mathrm{~mol}^{-1}$, triclinic $\mathrm{P}-1, a=10.5168(8), b=11.7533(9)$, $c=12.4547(10) \AA, \alpha=90.551(6), \beta=111.455(7), \gamma=107.402(7)^{\circ}, \mathrm{V}=1354.90(18) \AA^{3}, \mathrm{~T}=293(2) \mathrm{K}$, $\mathrm{Z}=2, \rho=1.437 \mathrm{Mg} / \mathrm{m}^{3}$, wavelength $1.71073 \AA, \mathrm{~F}(000)=608$, absorption coefficient $1.102 \mathrm{~mm}^{-1}$, index ranges $-12 \leq \mathrm{h} \leq 11,-14 \leq \mathrm{k} \leq 14,-11 \leq 1 \leq 15$, scan range $3.55 \leq \theta \leq 26.06^{\circ}$, 5346 independent reflections, $\mathrm{R}_{\text {int }}=0.0500$, 9894 total reflections, 344 refinable parameters, final R indices $[\mathrm{I}>2 \sigma(\mathrm{I})$ ] $\mathrm{R}_{1}=0.0558, \mathrm{wR}_{2}=0.1336, \mathrm{R}$ indices (all data) $\mathrm{R}_{1}=0.0785, \mathrm{wR}_{2}=0.1551$, goodness-of-fit on $\mathrm{F}^{2}$ 1.050 , largest difference peak and hole $0.877 /-0.748 \mathrm{e}^{-3}$. CCDC-878738 (for 3b), CCDC-878739 (for $\mathbf{4 a}$ ) and CCDC-878741 (for $\mathbf{4 b}$ ) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge at www.ccdc.cam.ac.uk/const/retrieving.html [or from the Cambridge Crystallographic Data Centre, 12, Union Road, Cambridge DB2 1EZ, UK; Fax: (internat.) +44-1223-336-033; E-Mail: deposit@ccdc.cam.ac.uk].

## 4. Conclusions

The reaction of 2-cyano-3-ferrocenylacrylonitrile (1) with malononitrile (2) in a $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ or 2- $\mathrm{PrOH} / \mathrm{H}_{2} \mathrm{O}$ medium in the presence of $\mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{NaOH}$, piperidine or morpholine affords products of multi-component condensation: 6-alkoxy-2-amino-, 2-amino-6-hydroxy-, 2,6-diamino-4-ferrocenylpiridine-3,5-dicarbonitriles $\mathbf{3 a - e}$, respectively, as well as products of multi-component cyclodimerization: 6-alkoxy-2-amino-4-ferrocenyl-3-ferrocenylmethyl-3,4-dihydropyridine-3,5dicarbonitriles $\mathbf{4 a}, \mathbf{b}$. This method can be widely used in the synthesis of various pyridine derivatives with ferrocenyl substituents. The reactions described in this study should be of interest to synthetic, theoretical and practical organic chemists seeking ways to prepare functionalized ferrocenylpyridines. The electrochemical behavior of compounds $\mathbf{3 b}, \mathbf{3 d}$ and $\mathbf{4 b}$ was investigated by means of cyclic voltammetry. For 3b and 3d two electrochemical processes (Ia,Ic), attributed to the oxidation and reduction of the ferrocene moieties were found. On the other hand, for compound $\mathbf{4 b}$ a double electron transfer for both ferrocene groups (Ia,IIa) and the electrochemical monogeneration of the dication species (Ic) were detected.

## Acknowledgments

This work was supported by CONACyT (Mexico, Grant 100970) and DGAPA-UNAM (Mexico, Grant IN 211112). Thanks are due to Eduardo Arturo Vázquez López and Vanessa Ramírez-Delgado for their technical assistance.

## Conflict of Interest

The authors declare no conflict of interest.
