# Crystal structure of 4-amino-5-chloro-2,6-dimethylpyrimidinium thiophene-2,5-dicarboxylate 

Ammaiyappan Rajam, ${ }^{\text {a }}$ Packianathan Thomas Muthiah, ${ }^{\text {a* }}$ Ray J. Butcher ${ }^{\text {b }}$ and Matthias Zeller ${ }^{\text {c }}$

${ }^{\mathbf{a}}$ School of Chemistry, Bharathidasan University, Tiruchirappalli 620024 , Tamilnadu, India, ${ }^{\mathbf{b}}$ Department of Chemistry, Howard University, 525 College Street NW, Washington, DC 20059, USA, and ${ }^{\text {c }}$ Department of Chemistry, Youngstown State University, 1 University Plaza, Youngstown, OH 44555, USA. *Correspondence e-mail: tommtrichy@yahoo.co.in

In the title salt, $\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{ClN}_{3}{ }^{+} \cdot \mathrm{C}_{6} \mathrm{H}_{3} \mathrm{O}_{4} \mathrm{~S}^{-}$, the cations and anions are linked via $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming $R_{6}^{6}(37)$ ring motifs that are interconnected with each other, producing sheets. Separate parallel inversionrelated sheets are linked through $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\pi-\pi$ stacking interactions [centroid-centroid distance $=3.5414$ (13) A ], forming double layers parallel to (101). Weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds, as well as $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions, connect the double layers into a three-dimensional network.

## 1. Chemical context

In crystal engineering, non-covalent interactions, such as hydrogen bonding, play a key role in molecular recognition processes (Desiraju, 1989). Pyrimidine derivatives have gained considerable importance because of their remarkable biological properties, for example as anti-fungal, antiviral, anticancer and anti-allergenic agents (Ding et al., 2004). Thiophenecarboxylic acid and its derivatives have attracted attention because of their wide range of pharmacological properties and numerous applications, such as the preparation of DNA hybridization indicators, single-molecule magnets, photoluminescence materials and the treatment of osteoporosis as inhibitors of bone resorption in the tissue culture (Bharti et al., 2003; Taş et al., 2014; Boulsourani et al., 2011). The present study investigates the hydrogen-bonding patterns in 4-amino-5-chloro-2,6-dimethylpyrimidinium thiophene-2,5dicarboxylate (I).

## 2. Structural commentary

The asymmetric unit of $\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{ClN}_{3}{ }^{+} \cdot \mathrm{C}_{6} \mathrm{H}_{3} \mathrm{O}_{4} \mathrm{~S}^{-}$, (I), contains one 4-amino-5-chloro-2,6-dimethylpyrimidinium cation and one thiophene-2,5-dicarboxylate anion (Fig. 1). Protonation of the pyrimidine occurs at atom N 1 , leading to a $\mathrm{C} 2 B-\mathrm{N} 1 B-$

Figure 1
The asymmetric unit of the title compound, showing $30 \%$ probability displacement ellipsoids. The dashed line indicates a hydrogen bond.

C6B angle of 122.5 (2) ${ }^{\circ}$ which an increase of $c a 3.8^{\circ}$ compared to the $\mathrm{C} 2 B-\mathrm{N} 3 B-\mathrm{C} 4 B$ angle $118.7(2)^{\circ}$ involving the unprotonated N 3 atom.

## 3. Supramolecular features

The carboxylate group of the thiophene-2,5-dicarboxylate anion interacts with the protonated N 1 atom of the pyrimidinium moiety with a single point heterosynthon via N $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1). In addition, the components are connected through $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) to form an $R_{6}^{6}(37)$ ring graph set motif. This

Figure 2

$\begin{aligned} & \text { Symmetry codes: } \\ & x-\frac{1}{2},-y+\frac{1}{2}, z+\frac{1}{2} ; \\ & \text { (i) }\end{aligned} \quad x+\frac{1}{2},-y+\frac{3}{2}, z-\frac{1}{2} ; \quad$ (ii) $\quad-x+2,-y+1,-z+1 ; \quad$ (v) $\quad-x+1,-y,-z+1$; $\quad x-\frac{1}{2},-y+\frac{3}{2}, z+\frac{1}{2} ; \quad$ (iii) $\quad$ (vi)
motif includes anions connected by $\mathrm{O}-\mathrm{H} . \mathrm{O}$ hydrogen bonds along [101] and involves the cations along [010] to form a 2D sheet (Fig. 2). Two separate 2D sheets (which are indicated in red and yellow in Fig. 3) are interconnected by a selfcomplementary base pair between the pyrimidinium moiety through $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond interactions with an $R_{2}^{2}(8)$ ring graph set motif and $\pi-\pi$ stacking interactions between the pyrimidinium ring and the thiophene ring with an observed interplanar distance of 3.4188 (10) $\AA$, a centroid-to-centroid (Cg1-Cg2) distance of $3.5414(13) \AA$ (where $C g 1$ is the centroid of the ring $\mathrm{N} 1 B / \mathrm{C} 2 B-\mathrm{C} 6 B$ and $C g 2$ is the centroid of the ring S1A/C2A-C5A) and slip angle (the angle between the centroid vector and the normal to the plane) of $18.0^{\circ}$; these are typical aromatic stacking values (Hunter, 1994). Through these interactions, parallel inversion-related sheets are connected into double layers parallel to (101). In addition, weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}, \mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ intermolecular interactions connect the double layers into a three-dimensional network (Fig. 3).

## 4. Database survey

The crystal structures of aminopyrimidine derivatives (Schwalbe \& Williams, 1982) and aminopyrimidine carboxylates (Hu et al., 2002), have been reported. Several co-crystals/ salts of aminopyrimidine derivatives have been reported from our laboratory including co-crystals/salts of aminopyrimidines with carboxylic acid (Muthiah et al., 2006; Devi \& Muthiah, 2007; Subashini et al., 2008; Thanigaimani et al., 2009; Ebenezer \& Muthiah, 2010, 2012; Ebenezer et al., 2011), aminopyrimidines-thiophenecarboxylic acid (Jegan Jennifer et al., 2014), the crystal structure of 2-amino-4,6-dimethoxy-pyrimidiniumthiophene-2-carboxylate (Rajam et al., 2015) and metal complexes with 4 -amino-5-chloro-2,6-dimethylpyrimidine (Karthikeyan et al., 2016)

## 5. Synthesis and crystallization

A hot DMF solution of 4-amino-5-chloro-2,6-dimethylpyrimidine ( 39 mg , Alfa Aesar) and thiophene-2,5-dicarboxylic acid ( 43 mg , Alfa Aesar) were mixed and warmed for

Figure 3
A view along the $b$ axis, showing double layers (indicated in red and yellow) formed by hydrogen bonds and $\pi-\pi$ stacking interactions. The weak $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds connect the double layers to form a three-dimensional network. Dotted lines represent $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ interactions. Solid lines indicate the stacking interactions.

half an hour over a water bath. The mixture was cooled slowly and kept at room temperature. After a few days colourless plate-like crystals were obtained.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The $\mathrm{N}-\mathrm{H}$ and $\mathrm{O}-\mathrm{H} \mathrm{H}$ atoms were located in difference Fourier maps and refined isotropically. All other H atoms were placed in calculated positions and refined using a riding-model approximation with $\mathrm{C}-\mathrm{H}=$ $0.95 \AA(\mathrm{CH})$ or $0.98 \AA\left(\mathrm{CH}_{3}\right)$. Isotropic displacement parameters for these atoms were set to $1.2(\mathrm{CH})$ or $1.5\left(\mathrm{CH}_{3}\right)$ times $U_{\text {eq }}$ of the parent atom. Idealized Me H atoms were refined as rotating groups. There are larger than expected residual density peaks close to the Cl and S atoms but these are not chemically sensible and are assumed to be related to the quality of the crystal.

## Acknowledgements

PTM is thankful to the UGC, New Delhi, for a UGC-BSR one-time grant to Faculty. The authors wish to acknowledge the United States National Science Foundation (grant No. 1337296) for funds to purchase the diffractometer.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
