The quinoxaline portion of the title molecule, C<sub>21</sub>H<sub>19</sub>N<sub>5</sub>O<sub>3</sub>, is not quite planar as indicated by a dihedral angle of 3.38 (7)° between the constituent rings. The molecule is ‘U-shaped’, which is consolidated by an intramolecular antiparallel carbonyl electrostatic interaction with C··O distances of 2.8905 (16) and 3.0221 (15) Å, in the crystal forms corrugated layers through C—H··O and C—H··N hydrogen bonds and C—H·· $\pi$ (ring) and  $\pi$ -stacking interactions.

## 3D view

## Chemical scheme

## Structure description

Quinoxaline derivatives exhibit a wide range of biological applications including antimicrobial (Teja *et al.*, 2016), anti-inflammatory (Guirado *et al.*, 2012), anticancer (Abbas *et al.*, 2015), antidiabetic (Kulkarni *et al.*, 2012) and antihistaminic (Sridevi *et al.*, 2010) effects. As a continuation of our research on the synthesis and biological properties of quinoxaline derivatives (Missioui *et al.*, 2022*a,b,c*), the title compound was prepared and its crystal structure is reported here.

The quinoxaline portion is not quite planar as indicated by a dihedral angle of 3.38 (7)° between the constituent rings. The dihedral angle between the C9–C14 and C1/C6/N1/C7/C8/N2 rings is 9.05 (8)° while that between the latter ring and the triazole ring is 78.47 (3)°. The molecule adopts a ‘U-shaped’ conformation, which is consolidated by an intramolecular antiparallel carbonyl electrostatic interaction (Allen *et al.*, 1998) between the C8=O1 and C19=O2 groups with C19··O1 = 2.890 Å and C8··O2 = 3.022 Å. In the crystal, C12–H12··N3 hydrogen bonds (Table 1) lead to the formation of chains

extending along the *c*-axis direction, which are linked into corrugated layers by C5—H5...N4 and C15—H15B...O2 hydrogen bonds and by C15—15A...Cg1 interactions (Table 1 and Fig. 2). These are accompanied by weak  $\pi$ -stacking interactions between C1/C6/N1/C7/C8/N2 and C1—C6 rings related by the symmetry operation  $x - \frac{1}{2}, y, -z - \frac{1}{2}$  [centroid-centroid distance = 3.8105 (7) Å, dihedral angle = 6.13 (6)°].

### Synthesis and crystallization

To a solution of 3-phenyl-1-(prop-2-yn-1-yl)quinoxalin-2(1*H*)-one (0.68 mmol) in ethanol (15 ml) was added ethyl 2-azidoacetate (1.03 mmol). The reaction mixture was stirred under reflux for 72 h. After completion of the reaction (monitored by TLC), the solution was concentrated and the residue was purified by column chromatography on silica gel by using a hexane/ethyl acetate mixture (9:1) as eluent. The solid product obtained was crystallized from ethanol solution to afford colorless crystals. Yield 80%, m.p. = 408–410 K. <sup>1</sup>H MNR (300 MHz, CDCl<sub>3</sub>)  $\delta$  (p.p.m.): 1.22–1.26 (*t*, 3H, CH<sub>3</sub>, *J* = 6 Hz); 4.12–4.19 (*q*, 2H, O—CH<sub>2</sub>, *J* = 6 Hz); 5.57 (*s*, 2H, N—CH<sub>2</sub>CO<sub>2</sub>); 5.60 (*s*, 2H, N—CH<sub>2</sub>); 7.72 (*s*, H, CH<sub>triazole</sub>); 7.44–8.31 (*m*, 9H<sub>arom</sub>); <sup>13</sup>C MNR (75 MHz, CDCl<sub>3</sub>)  $\delta$  (p.p.m.): 13.95 (CH<sub>3</sub>); 34.99 (O—CH<sub>2</sub>); 50.01 (N—CH<sub>2</sub>C=O); 62.48 (N—CH<sub>2</sub>); 113.48, 124.61, 128.19 (triazole), 129.52, 130.70, 130.85,

**Figure 1**

The title molecule with the labeling scheme and 50% probability ellipsoids. The  $\pi$  interaction between the C19=O2 carbonyl group and the C1/C6/N1/C7/C8/N2 ring is shown by an orange dashed line.

#### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.035$

$wR(F^2) = 0.087$

$S = 1.05$

3662 reflections

339 parameters

0 restraints

Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map

Hydrogen site location: difference Fourier map

All H-atom parameters refined

$w = 1/[\sigma^2(F_o^2) + (0.0384P)^2 + 1.2273P]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.24$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.21$  e Å<sup>-3</sup>

Extinction correction: *SHELXL 2018/1*

(Sheldrick, 2015*b*),

$F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$

Extinction coefficient: 0.00064 (5)

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

All H atom positional and Uiso values were freely refined.
