

Supplementary Figure 1. Pulmonary lesions and virus spread in the lungs of mice infected with A/bat/Egypt/381-OP/2017 (H9N2) and A/mallard/Alberta/17/1991 (H9N2) viruses. For each virus, DBA/2J mice (n = 3) were infected i.n. with 106 EID₅₀ of virus and were euthanized at 3 dpi (A–L) or 5 dpi (M–X). Lungs were harvested and fixed in 10% neutral-buffered formalin and stained with hematoxylin and eosin (HE), subjected to immunohistochemical staining with anti-NP antiserum, and analyzed by histomorphometry.

Supplementary Figure 2. Immunohistochemical staining for viral antigen in nasal sections of mice infected with A/bat/Egypt/381-OP/2017 (H9N2) and A/mallard/Alberta/17/1991 (H9N2). For each virus, DBA/2J mice ($n = 3$) were infected i.n. with 106 EID₅₀ of virus and euthanized at 3 dpi (A–D) or 5 dpi (E–H). Nasal turbinates were harvested and fixed in 10% neutral-buffered formalin. Sections were subjected to immunohistochemical staining with anti-NP antiserum and analyzed by histomorphometry.

Supplementary Figure 3. Histologic lesions and viral antigen expression in the lungs (A, D), nasal respiratory epithelium (B, E), and sloughed olfactory neuroepithelium (C, F) of ferrets inoculated with influenza A/bat/Egypt/381-OP/2017 (H9N2) virus. Ferrets (n = 2) were inoculated i.n. with 106 EID₅₀ of A/bat/Egypt/381-OP/2017 (H9N2) virus. At 3 dpi, ferret tissues were fixed in 10% neutral-buffered formalin, sectioned, and stained with hematoxylin–eosin (H&E). Sections were subjected to immunohistochemical staining with anti–NP antiserum or analyzed by histomorphometry.

Supplementary Figure 4. Replication and transmission of *A/bat/Egypt/381-OP/2017* (H9N2) and *A/mallard/Alberta/17/1991* (H9N2) influenza virus in mallard ducks. Viral titers in oropharyngeal (A, B) and cloacal (C, D) swabs of mallard ducks infected with *A/bat/Egypt/381-OP/2017* (H9N2) and *A/mallard/Alberta/17/1991* (H9N2) viruses. Virus shedding of both donor and contact ducks was monitored, and swabs were collected at 2, 4, and 6 days post inoculation/post contact. In each panel, the dotted line indicates the lower limit of detection of infectious virus by the EID50 assay. Source data are provided as a Source Data file.

Supplementary Table 1. summary of the array experiment and raw data in MIRAGE format

120	LN/6'SLN/6'SLN-TriN	
121	6'SLN/LeX/LeX-TriN	

Non-covalent Immobilization	All glycans are terminated with primary amine linker (either natural amino acid or chemical linker)
4. Arrayer (Printer)	
Description of Arrayer	MicroGrid II (Digilab)
Dispensing mechanism	Contact microarray pins (SMP3, ArrayIt)
Glycan deposition	Manufacturer estimation is 0.7 nl per spot. However, actual delivery volume of each printed spot is not determined. Each glycan was “pre-spotted” 3 times on Poly-L-Lysine derivatized slides (made in-house) before being spotted on SlideH slides. Each array contains 6 replicate spots of each individual glycan.
Printing conditions	Glycans were diluted to 100 uM in 150 mM sodium phosphate buffer pH 8.4, 0.005% Tween-20. 10 ul of each glycan was transferred to a 384-well microtiter plate and printed at ambient temperature and relative humidity of 50-65%.
5. Glycan Microarray with “Map”	
Array layout	Each slide contains 5 replicate arrays, consisting of a 4x2 (8) subarray pattern with each subarray containing 12x18 features (not all features contain a printed sample). Array Layout file = “SAv7.gal”
Glycan identification and quality control	In-house sialoside array, consisting of 122 defined glycans (Supplementary Table 1). Quality control was assessed by incubation with plant lectins, AAL, ECA and SNA, to monitor fucosylations, de-sialylation and NeuAc-a(2-6) terminated glycans, respectively.
6. Detector and Data Processing	
Scanning hardware	Innoscan 1100AL (Innopsys)
Scanner settings	Scanning resolution: 10 µm / pixel Laser channel: 532 PMT Voltages: Adjusted for each sample to achieve maximum signal without saturation of any single spot. Scan power: Adjusted for each sample to achieve maximum signal without saturation of any single spot.
Image analysis software	Mapix (Innopsys)
Data processing	Output .txt files containing calculated data were processed in MS Excel to determine the mean signal value of 6 replicate spots with highest and lowest signals removed (e.g. average of 4 spots).
7. Glycan Microarray Data Presentation	

Data presentation	The microarray binding results are in Figures 1D . Binding results are presented as bar graphs with bars representing averaged mean signal of each glycan and error bars representing standard deviation.
8. Interpretation and Conclusion from Microarray Data	
Data interpretation	No software or algorithms were used to interpret processed data.
Conclusions	Glycan binding of the bat-derived H9N2-like virus mimics that of the likely avian parent, with strong specificity for “avian” α 2-3-linked sialoside receptors.
