In the title compound, $[\text{Co}(\text{C}_8\text{H}_5\text{O}_4)(\text{C}_9\text{H}_6\text{N}_7)]_n$, the divalent Co^{II} atom is six-coordinated to three N atoms from two symmetrical 5-(pyridin-4-yl)-1H,2'H-3,3'-bi[1,2,4-triazole] (H₂pyttz) ligands and three O atoms from three symmetrical 3-carboxybenzoate (Hbdic) ligands, leading to a distorted {CoN₃O₃} octahedral coordination environment. Two Co^{II} cations are linked by four bridging carboxylate groups to generate a dinuclear [Co₂(CO₂)₄] unit. The dinuclear units are further connected into a chain along [010] via the Hbdic ligands. The other infinite chain, along [100], is formed through the H₂pyttz ligands. Finally, the two kinds of chains are cross-linked, by sharing the Co^{II} cations, into a two-dimensional network. In the crystal, adjacent layers are further linked by O—H···N hydrogen bonds into a three-dimensional framework.

1. Chemical context

In recent years, the design and synthesis of coordination polymers (CPs) or metal–organic frameworks (MOFs) have attracted great interest because of their fascinating architectures and potential applications in areas such as gas storage and separation, catalysis, fluorescence, magnetism, molecular recognition, conductivity etc (Kitagawa *et al.*, 2004; Zhou *et al.*, 2012; Cavka *et al.*, 2014; Zhang *et al.*, 2014; Huang *et al.*, 2017; Nath *et al.*, 2016; Ni *et al.*, 2017; Yi *et al.*, 2016; Sun *et al.*, 2016). It is well known that organic ligands play a crucial role in the rational design and synthesis of coordination polymers (Li & Sato, 2017; Sun & Sun, 2015). Among the many organo-nitrogen ligands, the rigid 5-(pyridin-4-yl)-1H,2'H-3,3'-bi(1,2,4-triazole) ligand (H₂pyttz) attracted our attention for the following reasons. First, the H₂pyttz ligand possesses seven potential N-donor coordination sites and can exhibit various coordination modes. Second, the uncoordinated N atoms are helpful for the construction of hydrogen bonds. The hydrogen bonds not only increase the diversity of coordination polymer structures, but also enhance their stability. With an increasing interest in H₂pyttz organometallic systems, we report herein on the synthesis and crystal structure of the title compound $[\text{Co}(\text{C}_8\text{H}_5\text{O}_4)(\text{C}_9\text{H}_6\text{N}_7)]_n$, (I).

OPEN ACCESS

2. Structural commentary

The asymmetric unit of (I) contains one independent Co^{II} cation, one partially deprotonated Hpytz⁻ ligand and one partial deprotonated Hbtc⁻ ligand. Notably, the deprotonated Hbtc⁻ ligand adopts two different coordination modes. The deprotonated carboxylate group has a bis(monodentate) coordination mode to bridge two Co^{II} centers while the undeprotonated carboxylic group adopts a monodentate mode. As shown in Fig. 1, the Co^{II} cation is six-coordinated to three carboxylic oxygen atoms from three symmetrical Hbtc⁻ ligands and three nitrogen atoms from two symmetrical Hpytz⁻ ligands in a distorted $[\text{CoN}_3\text{O}_3]$ octahedral coordination geometry. Four bridging carboxylate groups link two Co^{II} cations to generate a dinuclear $[\text{Co}_2(\text{CO}_2)_4]$ unit, which is

further connected into an infinite chain along the *b*-axis direction. There exist eight- and 16-membered metallamacrocycles in the chain structure. In the 16-membered metallamacrocycle, the dihedral angle between the two aromatic rings is 0°, indicating the parallel orientation of the two aromatic rings.

The other infinite linear chain is along the *a*-axis direction with a Co^{II}–Co^{II} distance of 6.5825 (5) Å and Co–Co–Co angle of 180.00° and it is also generated through the coordination between the Hpytz[–] ligands and the Co^{II} cations. In the complex, the Hpytz[–] ligand is almost coplanar, with dihedral angles of 7.48 (4), 6.87 (4) and 4.43 (4) ° between the pyridine and the two triazole rings, respectively. Finally, these two kinds of chains are cross-linked, by sharing the Co^{II} cations, into a two-dimensional network.

3. Supramolecular features

In the crystal, adjacent two-dimensional networks are packed parallel to each other in an $\cdots AAAA \cdots$ fashion (Fig. 2). It should be noted that the carboxylic oxygen atom O3 and the uncoordinated nitrogen atom N7 in adjacent networks interact with each other and form strong O3—H3 \cdots N7 hydrogen bonds (Table 1), which further link the two-dimensional networks into a three-dimensional supramolecular architecture.

4. Database survey

A search of the Cambridge Structural Database (Version 5.37; Groom *et al.*, 2016) for 5-(pyridin-4-yl)-1*H*,2'*H*-3,3'-bi(1,2,4-triazole) reveals five structures. Of these, there is only one Co^{II} coordination structure (ZOTDIX; Gong *et al.*, 2014). In this structure, the pyridyl nitrogen atom is not coordinated to the Co^{II} cation.

5. Synthesis and crystallization

A mixture of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ (0.10 mmol), 5-(pyridin-4-yl)- $1\text{H},2'\text{H}-3,3'$ -bi(1,2,4-triazole) (0.10 mmol), benzene-1,3-dicarboxylic acid (0.10 mmol) and H_2O (10 ml) was stirred at room temperature for 30 min. When the pH value had been adjusted to about 7.0 with 0.1 M NaOH, the mixture was sealed in a 20 ml Tefon-lined stainless-steel reactor and then heated to 433 K for 72 h under autogenous pressure, and then slowly cooled to room temperature at a rate of 5 K h^{-1} . Pink block-shaped crystals of the title complex were isolated, washed with distilled water, and dried in air (yield 52%).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms attached to C and N atoms were placed in calculated positions (C—H = 0.93 Å,

N—H = 0.86 Å) and refined as riding atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C,N})$, respectively. The carboxyl H atom was located in the difference Fourier-map and refined isotropically with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
