Environmentally friendly domino multicomponent strategy for the synthesis of pyrroloquinolinone hybrid heterocycles†

 Suresh Mani,^a Rajesh Raju,^b  ^{*,a} Raghavacharry Raghunathan,^{*,a} Natarajan Arumugam,^b  ^b Abdulrahman I. Almansour,^b Raju Suresh Kumar  ^b and Karthikeyan Perumal^c

An efficient and elegant assembly of pyrene/aryl fused pyrrolo[2,3-*b*]quinolinone and pyrrolizino[3,2-*b*]quinolinone hybrid heterocycles was achieved *via* a domino multicomponent reaction strategy using a solid state melt reaction (SSMR) condition. The 1,3-dipole component was generated *in situ* from *N*-methylglycine/*L*-proline and isatin, while the Baylis–Hillman adduct prepared from pyrene-1-carbaldehyde and various benzaldehydes is used as the dipolarophile. The domino protocol comprises 1,3-dipolar cycloaddition and a consequent double annulation reaction process. The advantages of this cascade protocol include environmentally friendly conditions, the avoidance of toxic organic solvents, simple work-up and good to excellent product yields.

Introduction

Domino multicomponent reaction is an attractive synthetic methodology that creates several transformations with notable advantages such as high reaction efficiency, convergence, elegance, cost savings, simple automation and minimization of synthetic work up steps.¹ This protocol obviates the isolation and purification steps which leads to an improvement in the overall yield compared to classical multistep synthetic transformations in a single pot manipulation and represents an attractive synthetic method for building hybrid heterocyclic architectures.² Besides, this protocol is well suited for the production of structurally diverse hybrid heterocycles with multiple stereogenic centers and biologically relevant molecules.³

Domino multicomponent reactions involving 1,3-dipolar cycloadditions are attractive in this connection as this reaction allows for the efficient assembly of biologically relevant five-membered heterocycles. This synthetic protocol has recently received considerable attention in organic synthesis.^{4–7} In particular, the synthesis of the pyrrolidine unit by the reaction of alkenes with azomethine ylides gains importance because of

their occurrence in numerous bioactive natural products.^{8–10} In this context, we recently reported the synthesis of structurally unusual hybrid heterocycles comprising spiropyrrolidine units¹¹ and pyrroloquinolinone analogs prepared from Baylis–Hillman adducts *via* the multicomponent 1,3-dipolar cycloaddition and domino reaction sequence.¹² Spiropyrrolidine analogues possess an interesting biological profiles including antimicrobial,¹³ anti-cancer¹⁴ and anti-Alzheimer^{15,16} activities. Pyrroloquinolinone analogs are found to be an essential component of many natural products such as melodinus alkaloids, (+) scandin, (+) meloscine, meloscandinone^{17,18} which are used in traditional Chinese folkmedicine to treat meningitis in children and rheumatic heart disease.

With an aim to construct novel heterocycles comprising pyrrolo [3,2-*c*]quinolino/pyrrolizino [2,3-*c*] quinolinone, we have now investigated the synthetic utility of Baylis–Hillman adducts as dipolarophiles through sustainable green domino protocol that involves a decarboxylative 1,3-dipolar cycloaddition^{19–21} followed by a double annulation *via* sequential lactonization and lactamization reactions. Our synthetic strategy employed for the synthesis of pyrroloquinoline heterocycles is shown in Fig. 1.

Results and discussion

The structurally unexplored new class of highly functionalized starting precursors *viz.* 3-(1,8-dihydropyren-1-yl)-2-methylenebutanoate **3** and various substituted methyl 2-(hydroxy(phenyl)methyl)acrylate **5** were required for the synthesis of pyrroloquinolinones, which were synthesized from pyrene-1-carbaldehyde **2** and various substituted benzaldehydes

4 by the Baylis–Hillman reaction (Scheme 1). Incidentally, pyrene is important polycyclic aromatic ring system that has been shown diverse biological activity including cytotoxicity against human cancer cell lines.²²

The domino multicomponent reaction was carried out by the reaction of isatin **6**, sarcosine **7** and the Baylis–Hillman adduct **3** under solvent free melting conditions to furnish the unexpected pyrene tethered pyrroloquinolinone hybrids **9a–d** in excellent yields (Scheme 2). Firstly, the domino reaction was examined with various solvent systems such as CH₃CN, toluene, xylene and dioxane as summarized in Table 1. However, even after a longer reaction time under these solvent conditions, we did not obtain any fruitful results, but instead ended up with an inseparable mixture of the products. Ultimately, the domino reaction was carried out under solid state melt reaction conditions. Thus, in a typical reaction, the starting substrate **3**, **6a** and **7** in a round bottom flask at 180 °C under solvent free conditions afforded the desired product **9a** in 93% yield without column purification. It was found that 180 °C was the optimum temperature for this solid-state melt reaction in terms of both yield and time. The reaction was also performed with Baylis–Hillman adduct **5a–c** under the above optimized reaction conditions, which afforded **10** in good to excellent yields. It is

Scheme 2 Synthesis of pyrroloquinolinone hybrids **9a–d** and **10a–c**.

pertinent to note that the compounds synthesized are racemates which has been indicated in Table 2.

The formation of the pyrroloquinoline **9a** was unambiguously determined by spectroscopic data. In the ¹H and ¹³C NMR spectrum of **9a**, interestingly, the absence of the methoxy(–OCH₃) and the –OH groups confirm the formation of the unusual cyclized product. In the ¹H NMR spectrum, the hydrogens of the –NCH₃ unit and –NH of lactam resonated as singlet at δ 2.63 and 10.78 ppm respectively. The –NCH₂ hydrogens of the pyrrolidine ring exhibited as multiplets at δ 2.84 and δ 3.07. In the ¹³C NMR spectra, the carbon signals at δ 178.9 and 173.2 ppm were ascribable to quinolinone and lactone ring carbonyl carbons, respectively. The carbon signal at δ 39.3 ppm was assignable to –NCH₃ carbon and the two carbon signals at δ 64.3 and 78.5 ppm were due to two bridged quaternary carbons, respectively. The two methylene groups appeared in negative region at δ 30.9 and 57.3 ppm which was further confirmed by DEPT-135 NMR spectrum. The observed chemical shifts are in agreement with the structure of **9a**. Finally, compound **9a** was unambiguously determined by single crystal X-ray crystallographic analysis as shown in Fig. 2.²³

Further, we have extended the scope of this multicomponent cascade transformation, by using cyclic amino acid namely L-proline, as described in Scheme 3. Thus, the reaction of non-stabilized azomethine ylides generated *in situ* from isatin **6a–c** and L-proline **11** with the Baylis–Hillman adduct **3** under the

optimized conditions afforded pyrrolizinoquinolinone hybrids **12a–c** in good yields. The structure of pyrrolizinoquinolinone was elucidated by spectroscopic data.

A likely mechanistic pathway for the assembly of pyrroloquinolinone hybrids *via* the multicomponent domino reaction is shown in Scheme 4. Initially, the reaction of isatin **6** and

sarcosine **7** forms the non-stabilized 1,3-dipole component **13** through spontaneous dehydration and decarboxylation. Subsequently, the reaction of dipole component **13** with the dipolarophile **3** can take place through spiro intermediate **14** or **8** to furnish **9**. Thus, the exclusive formation of spiro intermediate **8** in the cycloaddition process shows that compound **8** is

Fig. 2 ORTEP diagram of compound 9a.

Scheme 3 Synthesis of pyrene fused pyrrolidinoquinolines

Scheme 4 Plausible reaction pathway for the formation of 9.

favoured over compound 14. Subsequently, the hydroxyl group of spiro intermediate 8 underwent an intramolecular nucleophilic attack on the carbonyl of the adjacent oxindole ring, leading to the formation of the intermediate 15, which in turn led to an aniline intermediate 16 through stabilization of the oxygen anion. Finally, the amino group was cyclized to the final product 9 by nucleophilic attack on ester carbonyl followed by elimination of the methoxy group. Formation of an unusual

product by two C–N, three C–C bonds that have three stereogenic center in single-pot synthetic operation.

Conclusions

In summary, we have successfully synthesized structurally interesting unexplored new class of pyrene/aryl derived pyrroloquinolinone and pyrene derived pyrrolidinoquinoline hybrid heterocycles employing domino multicomponent reaction strategy under eco-friendly solid-state melt reaction conditions. Besides, the starting precursor, the electron deficient pyrene alkene, was synthesized for the first time in excellent yield through Baylis–Hillman reaction. The domino reaction involves 1,3-dipolar cycloaddition followed by double annulation cascade reaction process, the product generates up to three stereocenter *via* two C–N and three C–C bonds. It is noteworthy to mention that this domino reaction was performed under solvent and catalyst free conditions, which is very attractive from green chemistry perspective.

Experimental

General considerations

^1H and ^{13}C NMR spectra were determined on a BRUKER 300 MHz NMR instrument in chloroform- d_6 solvent with trimethyl silane (TMS) as a reference standard. High resolution mass spectra were obtained by ESI using Orbitrap elite mass spectrometer. C, H and N analyses were performed using PerkinElmer CHNS 2400B instrument. The X-ray diffraction analysis was determined on a Bruker (2008) SMART APEX II detector diffractometer. Silica gel (mesh size 100–200) was used for column chromatography and hexane and ethyl acetate as eluent. The reaction was monitoring by thin layer chromatography (TLC) developed on 25 mm silica gel-G (ACME) coated glass plates and monitoring by iodine.

General procedure for synthesis of BAH, 3/5

A mixture of methyl acrylate 1 (1.5 mmol), pyrene-1-carbaldehyde 2 (1.0 mmol)/substituted benzaldehydes 4 (1.0 mmol) and DABCO (0.1 mmol) were allowed to stand at ambient temperature for 12–15 days. Upon completion of the reaction as evidenced by TLC analysis, the reaction mixture was diluted with ethyl acetate (20 mL) and washed successively with 2 N HCl solution, H_2O and aqueous sodium bicarbonate solution. Organic solvent was dried over anhydrous Na_2SO_4 and evaporated under vacuo. The residue was purified using column chromatography using hexane : EtOAc (8 : 2 v/v) to afford the alcohol 3/5.

Methyl 2-(hydroxy(pyren-1-yl)methyl)acrylate 3. ^1H NMR (300 MHz, CDCl_3): δ 3.72 (s, $-\text{OCH}_3$, 3H), 5.56 (s, 1H), 6.35 (s, 1H), 6.62 (s, 1H), 7.94–8.23 (m, 9H). ^{13}C NMR (75 MHz, CDCl_3): 52.11, 69.63, 123.0, 124.5, 124.7, 124.9, 125.2, 125.3, 125.9, 127.1, 127.4, 127.5, 127.8, 128.2, 130.6, 131.1, 131.3, 133.9, 142.2, 167.2 ppm. Mass: m/z 316.15 (M^+).

General procedure for synthesis of fused pyrrolo[3,2-*c*]quinolinone hybrids, 9/10

A mixture of BHA 3/5 (1 mmol), isatin 6 (1.1 mmol) and sarcosine 7 (1.1 mmol) was placed in a flask and melted at 180 °C, the completion of the reaction as confirmed by TLC. After the disappearance of the starting materials, the crude product was recrystallized with mixture of 5 mL ethyl acetate and hexane (ratio 1 : 4), successfully gave the pure desired product 9/10 as a solid.

Mass: *m/z* 379.11 (M⁺): anal. calcd. For C₂₀H₁₇N₃O₅: C, 63.32, H, 4.52, N, 11.08%; found: C, 63.37, H, 4.55, N, 11.10%.

(6aR*,7aR*,11aR*,14R*)-14-(Pyren-1-yl)-7a,8,9,10-tetrahydro-5H-6a,11a-(methanooxymethano)pyrrolizino[2,3-*c*]quinoline-6,12(7H)-dione, 12a. Colorless solid (94%), Mp: 248–250 °C, IR (KBr): 1719, 1748 cm⁻¹; ¹H NMR (300 MHz, CDCl₃ + DMSO-*d*₆): δ 1.32–1.34 (m, 1H), 1.60–1.68 (m, 2H), 1.99–2.04 (m, 2H), 2.39–2.44 (m, 1H), 2.53–2.63 (m, 2H), 3.66–3.72 (m, 1H), 6.59 (s, 1H), 7.18–7.48 (m, 3H), 7.78 (d, *J* = 8.1 Hz, 1H), 8.05–8.32 (m, 9H), 11.17 (s, 1H, N-H). ¹³C NMR (75 MHz, CDCl₃ + DMSO-*d*₆): 29.9, 36.9, 39.5, 53.9, 64.3, 68.1, 81.9, 119.6, 121.5, 127.6, 128.5, 128.9, 129.2, 129.3, 129.5, 130.3, 130.7, 131.3, 132.2, 132.5, 132.7, 133.0, 133.3, 133.6, 135.1, 135.6, 135.9, 136.1, 143.8, 173.2, 180.5 ppm. Mass: *m/z* 484.19 (M⁺). Anal. calcd. For

C₃₂H₂₄N₂O₃: C, 79.32, H, 4.99, N, 5.78% found: C, 79.35, H, 4.96, N, 5.75%.

(6aR*,7aR*,11aR*,14R*)-2-Chloro-14-(pyren-1-yl)-7a,8,9,10-tetrahydro-5H-6a,11a-(methanooxymethano)pyrrolizino[2,3-c]quinoline-6,12(7H)-dione, 12b. Colorless solid (91%), Mp: 256–258 °C, IR (KBr): 1719, 1748 cm⁻¹; ¹H NMR (300 MHz, CDCl₃ + DMSO-d₆): δ 1.32–1.36 (m, 1H), 1.67–1.71 (m, 2H), 1.96–2.11 (m, 2H), 2.42–2.68 (m, 3H), 3.67–3.72 (m, 1H), 6.65 (s, 1H), 7.27–8.34 (m, 12H), 11.29 (s, 1H, N-H). ¹³C NMR (75 MHz, CDCl₃ + DMSO-d₆): 24.5, 31.4, 34.6, 48.6, 58.8, 62.9, 76.4, 116.0, 117.9, 122.3, 123.7, 123.9, 124.1, 124.2, 125.1, 125.5, 126.0, 126.5, 127.3, 127.5, 127.8, 127.9, 128.1, 128.4, 129.9, 130.4, 130.6, 131.0, 137.3, 167.8, 174.9 ppm. Mass: *m/z* 518.19 (M⁺). Anal. calcd. For C₃₂H₂₃ClN₂O₃: C, 74.06, H, 4.47, N, 5.40% found: C, 74.09, H, 4.45, N, 5.43%.

(6aR*,7aR*,11aR*,14R*)-2-Bromo-14-(pyren-1-yl)-7a,8,9,10-tetrahydro-5H-6a,11a-(methanooxymethano)pyrrolizino[2,3-c]quinoline-6,12(7H)-dione, 12c. Colorless solid (92%), Mp: 259–261 °C, IR (KBr): 1725, 1756 cm⁻¹; ¹H NMR (300 MHz, CDCl₃ + DMSO-d₆): δ 1.34–1.42 (m, 1H), 1.68–1.80 (m, 2H), 2.04–2.17 (m, 3H), 2.45–2.57 (m, 1H), 2.73–2.80 (m, 1H), 3.73–3.79 (m, 1H), 6.56 (s, 1H), 7.23 (s, 1H), 7.54 (s, 1H), 7.66 (s, 1H), 8.00–8.26 (m, 9H), 11.16 (s, 1H, N-H). ¹³C NMR (75 MHz, CDCl₃ + DMSO-d₆): 29.8, 36.7, 39.6, 54.0, 64.2, 68.2, 82.3, 121.4, 123.2, 127.1, 129.1, 129.3, 130.1, 130.6, 131.0, 132.0, 132.5, 132.9, 133.3, 135.1, 135.9, 136.3, 138.5, 173.2, 180.3 ppm. Mass: *m/z* 562.11 (M⁺). Anal. calcd. For C₃₂H₂₃BrN₂O₃: C, 68.21, H, 4.11, N, 4.97% found: C, 68.24, H, 4.08, N, 4.95%

Conflicts of interest

There is no conflict of interest.
