The crystal structures of five 6-mercaptopurine derivatives, *viz.* 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(3-methoxyphenyl)ethan-1-one (**1**),  $C_{16}H_{14}N_4O_3S$ , 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-methoxyphenyl)ethan-1-one (**2**),  $C_{16}H_{14}N_4O_3S$ , 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-chlorophenyl)ethan-1-one (**3**),  $C_{15}H_{11}ClN_4O_2S$ , 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-bromophenyl)ethan-1-one (**4**),  $C_{15}H_{11}BrN_4O_2S$ , and 1-(3-methoxyphenyl)-2-[(9*H*-purin-6-yl)sulfanyl]ethan-1-one (**5**),  $C_{14}H_{12}N_4O_2S$ . Compounds (**2**), (**3**) and (**4**) are isomorphous and accordingly their molecular and supramolecular structures are similar. An analysis of the dihedral angles between the purine and exocyclic phenyl rings show that the molecules of (**1**) and (**5**) are essentially planar but that in the case of the three isomorphous compounds (**2**), (**3**) and (**4**), these rings are twisted by a dihedral angle of approximately  $38^\circ$ . With the exception of (**1**) all molecules are linked by weak C—H $\cdots$ O hydrogen bonds in their crystals. There is  $\pi$ — $\pi$  stacking in all compounds. A Cambridge Structural Database search revealed the existence of 11 deposited compounds containing the 1-phenyl-2-sulfanylethanone scaffold; of these, only eight have a cyclic ring as substituent, the majority of these being heterocycles.

### 1. Chemical context

Purines, purine nucleosides and their analogs, are nitrogen-containing heterocycles ubiquitous in nature and present in biological systems like man, plants and marine organisms (Legraverend, 2008). These types of heterocycles take part of the core structure of guanine and adenine in nucleic acids (DNA and RNA) being involved in diverse *in vivo* catabolic and anabolic metabolic pathways.

6-Mercaptopurine is a water insoluble purine analogue, which attracted attention due to its antitumor and immunosuppressive properties. The drug is used, among others, in the treatment of rheumatologic disorders, cancer and prevention of rejection of organ transplantation. The main problem associated with the pharmacological treatment with 6-mercaptopurine is the low bioavailability of the oral absorption and the short half-life in plasma. Strategies that have been adopted to circumvent those problems include the administration of 6-mercaptopurine analogues that act as prodrugs or by the chemical protection of the thiol group.

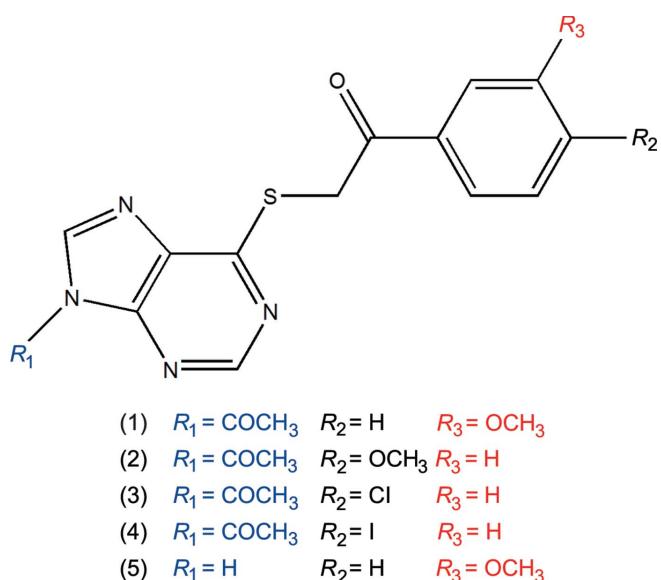

Chemically, the 6-mercaptopurine scaffold can also be modulated by an appropriate selection of the substituents that can be located at C-2, N-1, C-6, N-3, C-8, N-7 and N-9 posi-

OPEN ACCESS

tions, generating a variety of derivatives with potential biological applications (Legraverend & Grierson, 2006; Tunçbilek, *et al.*, 2009).

Within this framework, the goal of this project has been focused on the functionalization of 6-mercaptopurine at positions 6 and 9. Here we describe the syntheses and characterization of five 6-mercaptopurine derivatives: 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(3-methoxyphenyl)ethan-1-one (**1**), 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-methoxyphenyl)-ethan-1-one (**2**), 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-chlorophenyl)ethan-1-one (**3**), 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-bromophenyl)ethan-1-one (**4**) and 1-(3-methoxyphenyl)-2-[(9*H*-purin-6-yl)sulfanyl]ethan-1-one (**5**).

## 2. Structural commentary

Compounds (**1**)–(**5**) are shown in the scheme and their ellipsoid plots are shown in Figs. 1–5. Compounds (**1**) and (**5**) have similar *a* and *c* axes and (**2**), (**3**) and (**4**) are isostructural and isomorphous.

These compounds can be envisaged as two building blocks, a substituted phenylethanone grouping and a substituted 6-mercaptopurine moiety, bonded together by the mercapto ethanone residue. Since both purine and phenyl rings are essentially planar, the structural conformations of those compounds are conditioned by the  $-\text{SCH}_2\text{CO}$  spacer (Fig. 6) which permits rotations around the following bonds: Pu—S6, S6—C61, C61—C62 and C62—Ph bonds. The  $sp^3$  character of the central carbon atom may also direct the relative positions of the acetophenone residue out of the main plane constituted by the 6-mercaptopurine, which is not the case of the present compounds. Selected geometric parameters for compounds (**1**)–(**5**) are given in Tables 1–5, respectively.

The Pu—S6 bond tends to be coplanar with the purine residue. In fact, the 6-mercaptopurine itself may appear in the thione form, *e.g.* 3,7-dihydropurine-6-thione, as a consequence of the high degree of electron delocalization within the 6-

mercaptopurine environment. The tendency for the Pu—S6 bond to assume partial double-bond character is also seen in the present compounds, for which the corresponding Pu—S6 bond lengths lie between 1.741 (3)  $\text{\AA}$  for (2) and 1.755 (3)  $\text{\AA}$  for (4). In contrast, the S6—C61 bond lengths are longer, with values lying between 1.8017 (18)  $\text{\AA}$  in (1) and 1.812 (3)  $\text{\AA}$  in (4). This bond can also be bent with respect to the main mercaptopurine plane. The degree of bending may be evaluated by the distance of the C62 carbon atom from the mean plane consisting of the mercaptopyrimidine atoms. Those values [0.307 (3), 0.272 (4), 0.333 (2), 0.332 (4) and 0.164 (2)

**Table 6**Selected dihedral angles ( $^\circ$ ).

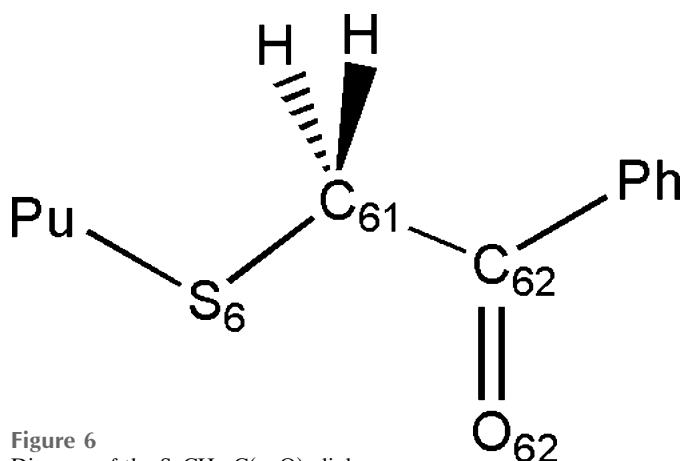

$\theta_1$  is the dihedral angle between the mean planes of the purine and phenyl rings and the phenyl ring.  $\theta_2$  is the dihedral angles between the mean planes of the purine ring and the plane defined by the S6/C61/C62/O6 atoms.  $\theta_3$  is the dihedral angle between the mean planes of the phenyl ring and the plane defined by the S6/C61/C62/O6 atoms.

Compound	$\theta_1$	$\theta_2$	$\theta_3$
(1)	2.95 (7)	8.45 (8)	5.87 (9)
(2)	38.89 (9)	17.05 (12)	22.72 (13)
(3)	38.67 (6)	14.23 (8)	27.82 (8)
(4)	37.11 (10)	13.58 (13)	26.82 (14)
(5)	4.74 (5)	5.30 (5)	3.42 (8)

The maximum deviations from the mean plane of the S—C—C—O bridging unit are for compounds (1)–(5) are 0.0457 (13), -0.041 (2), -0.023 (11), -0.017 (2) and 0.0302 (8)  $\text{\AA}$  respectively. In all cases it is atom C42 which shows the maximum deviation.

for (1)–(5), respectively] show that the degree of bending is higher in (1)–(4) than in (5). As regards the ethanone group, the C61—C62 bond lengths lie in the range 1.510 (4)  $\text{\AA}$  (2) to 1.528 (4)  $\text{\AA}$ , (4) and are normal for a  $\text{Csp}^3$ — $\text{Csp}^3$  bond while the C62—Ph bond lengths are shorter and lie in the range 1.474 (3)  $\text{\AA}$  (2) to 1.496 (4) (4), suggesting that the electron density is delocalized from the phenyl ring.

The dihedral angles between the mean planes of the purine and phenyl ring,  $\theta_1$ , those between the mean plane of the purine ring and the plane defined by the S6—C61—C62—O6 atoms,  $\theta_2$ , and those between the mean planes of the phenyl ring and the plane defined by the S6—C61—C62—O6 atoms,  $\theta_3$  are given in Table 6. These values show that the molecules of (1) and (5) are essentially planar. However, in the case of the three isomorphous compounds (2), (3) and (4), the purine and exocyclic phenyl rings are both twisted in the opposite direction from the plane of the bridging unit, resulting in a dihedral angle of approximately 38°. This is due to the rotations and bending around the bonds connecting the bridging unit to the purine and exocyclic phenyl rings as discussed above. The dihedral angles  $\theta_2$  are higher than  $\theta_3$ ; the former are mainly due to the rotations around the S6—C61 bond while the latter are mainly the result of the bending of the C62—Ph bond.

### 3. Supramolecular features

There are no weak C–H $\cdots$ O or C–H $\cdots$ N contacts in (1). Hydrogen bonds for (2)–(5) are listed in Tables 7–10, respectively. Since (2), (3) and (4) are isomorphous, their supramolecular structures follow similar patterns. Accord-

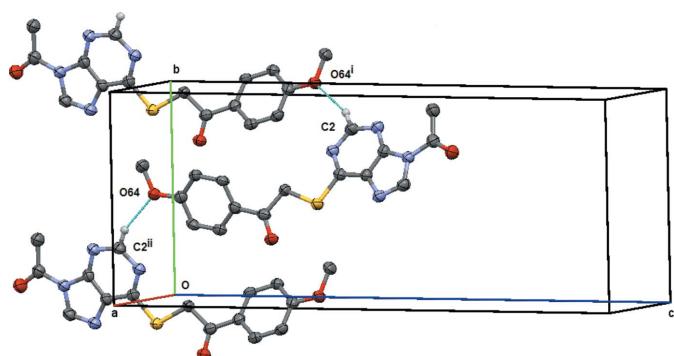

**Figure 7**

Compound (2): view of the  $\text{C}8-\text{H}8\cdots\text{O}9$  centrosymmetric  $R_2^2(16)$  ring structure centred on  $(-\frac{1}{2}, \frac{1}{2}, -\frac{1}{2})$ . Symmetry code: (i)  $-x-1, -y+1, -z+1$ . H atoms not involved in the hydrogen bonding are omitted.

**Figure 8**

Compound (2): the simple  $C4$  chain formed by the  $\text{C}61-\text{H}61A\cdots\text{O}6$  weak hydrogen bond. This chain extends along the  $b$  axis and is generated by the twofold screw axis at  $(\frac{1}{2}, y, \frac{1}{4})$ . Symmetry codes: (i)  $-x+1, y+\frac{1}{2}, -z+\frac{1}{2}$ ; (ii)  $-x+1, y-\frac{1}{2}, -z+\frac{1}{2}$ . H atoms not involved in the hydrogen bonding are omitted.

**Figure 9**

Compound (2): the simple  $C12$  chain formed by the  $\text{C}2-\text{H}2\cdots\text{O}64$  weak hydrogen bond. This chain extends along the  $b$  axis and is generated by the twofold screw-axis at  $(1, y, \frac{1}{4})$ . Symmetry codes: (i)  $-x+2, y+\frac{1}{2}, -z+\frac{1}{2}$ ; (ii)  $-x+2, y-\frac{1}{2}, -z+\frac{1}{2}$ . H atoms not involved in the hydrogen bonding are omitted.

ingly, hydrogen-bonding diagrams are given for (2) only. Atom C8 acts as a donor to O9 ( $-x-1, -y+1, -z+1$ ), via H8 forming an  $R_2^2(10)$  centrosymmetric dimer across the inversion centre at  $(-1/2, 1/2, 1/2)$ , Fig. 7. Atom C61 makes a hydrogen bond with O6 ( $-x+1, y+\frac{1}{2}, -z+\frac{1}{2}$ ), via H61A, forming a  $C4$  chain, which runs parallel to the  $b$  axis, Fig. 8, generated by the twofold screw axis at  $(1/2, y, 1/4)$ . In (2), there is a short contact between C6 and the 4-methoxy atom O64 ( $-x+2, y+\frac{1}{2}, -z+\frac{1}{2}$ ), forming a  $C12$  chain, Fig. 9, which runs parallel to the  $b$  axis and is generated by the twofold screw axis at  $(1, y, \frac{1}{4})$ . In (5), the  $\text{N}9-\text{H}9\cdots\text{N}9$  ( $x-\frac{1}{2}, -y+\frac{1}{2}, z-\frac{1}{2}$ ) hydrogen bond, Fig. 10, links the molecules into a  $C4$  chain which runs parallel to  $[\bar{1}01]$  and which is generated by the  $n$ -glide plane at  $(0, \frac{1}{4}, 0)$ .

Since those compounds have three rings, the imidazole ring (with centroid  $Cg1$ ), the pyrimidine ring (with centroid  $Cg2$ ) and the benzyl ring (with centroid  $Cg3$ ), it would be expected that  $\pi\cdots\pi$  contacts were part of the supramolecular structure. Table 11 lists the possible  $\pi\cdots\pi$  contacts for (1)–(5). As may be seen in the Table, the pyrimidine ring establishes  $\pi\cdots\pi$  contacts with the benzyl ring for all compounds. In (1), two molecules centrosymmetrically related across the inversion centre at

**Table 11**Selected  $\pi\cdots\pi$  contacts ( $\text{\AA}$ ,  $^\circ$ ).

$CgI(J)$  is plane  $I(J)$ ;  $Cg\cdots Cg$  is the distance between ring centroids;  $\alpha$  is the dihedral angle between planes  $I$  and  $J$ ;  $CgI_{\text{perp}}$  is the perpendicular distance of  $Cg(I)$  on ring  $J$ ;  $CgJ_{\text{perp}}$  is the perpendicular distance of  $Cg(J)$  on ring  $I$ ; Slippage is the distance between  $Cg(I)$  and the perpendicular projection of  $Cg(J)$  on ring  $I$ . Plane 1 is through the imidazole ring, plane 2 the pyrimidine ring and plane 3 the exocyclic benzene ring.

Compound	$CgI$	$CgJ$	$Cg\cdots Cg$	$\alpha$	$CgI_{\text{perp}}$	$CgJ_{\text{perp}}$	Slippage
(1)	$Cg1$	$Cg3(-x, 1 - y, 1 - z)$	3.6923 (14)	2.62 (12)	3.4547 (9)	-3.3985 (9)	1.969
	$Cg2$	$Cg3(-x, 1 - y, 1 - z)$	3.6019 (12)	3.26 (11)	-3.3477 (9)	-3.4071 (9)	
(2)	$Cg1$	$Cg3(-x, 1 - y, -z)$	3.8561 (16)	0.00 (15)	3.3156 (11)	3.3156 (11)	2.009
	$Cg2$	$Cg3(1 - x, \frac{1}{2} + y, \frac{1}{2} - z)$	3.8270 (16)	0.80 (12)	-3.2463 (10)	-3.2391 (11)	
(3)	$Cg1$	$Cg1(-x, 1 - y, -z)$	3.7799 (11)	0	3.2016 (7)	3.2016 (7)	2.110
	$Cg2$	$Cg3(1 - x, \frac{1}{2} + y, \frac{1}{2} - z)$	4.0620 (10)	6.70 (8)	-3.4438 (7)	-3.1708 (7)	
(4)	$Cg1$	$Cg1(1 - x, 1 - y, 1 - z)$	3.8319 (18)	0.04 (18)	3.1987 (13)	3.1987 (13)	2.110
	$Cg2$	$Cg3(1 - x, \frac{1}{2} + y, \frac{1}{2} - z)$	4.1601 (18)	6.27 (15)	-3.4328 (12)	-3.1701 (13)	
(5)	$Cg1$	$Cg3(-x, 1 - y, 1 - z)$	3.6359 (8)	5.35 (7)	-3.4757 (5)	-3.4162 (5)	2.110
	$Cg2$	$Cg3(-x, 1 - y, 1 - z)$	3.5204 (8)	4.43 (6)	-3.3669 (5)	-3.4160 (5)	

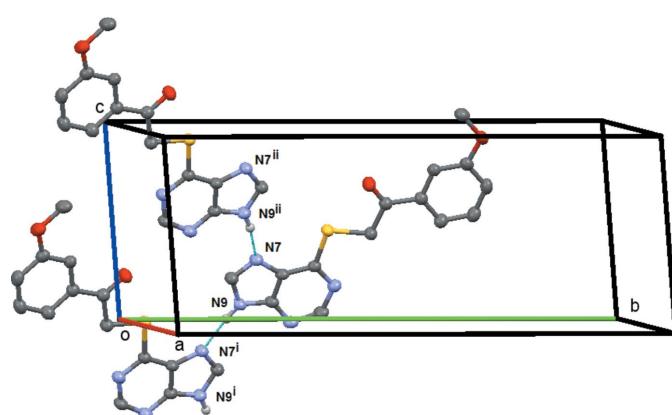

(0,  $\frac{1}{2}$ ,  $\frac{1}{2}$ ) are involved in  $\pi\cdots\pi$  stacking in which the purine ring stacks above the exocyclic phenyl ring. In (2), (3) and (4), the  $\pi\cdots\pi$  stacking is between imidazole rings while in (1) and (5), the contact is between an imidazole ring and a benzyl ring. In particular, in (1) and (5) two molecules centrosymmetrically related across the centre of symmetry at (0,  $\frac{1}{2}$ ,  $\frac{1}{2}$ ) are involved in  $\pi\cdots\pi$  stacking in which the purine rings stack above the exocyclic phenyl ring, Table 11.

#### 4. Database survey

A search made in the Cambridge Structural Database (Groom & Allen, 2014) revealed the existence of 11 deposited compounds containing the 2-thio-1-phenylethanone scaffold (see supplementary Figure). Of those, only eight have a cyclic ring as substituent, the majority of these being heterocycles: MUCCUJ: 2-(1,3-benzoxazol-2-ylsulfanyl)-1-phenylethanone (Loghmani-Khouzani *et al.*, 2009a); NENFAO: 3-(benzoylmethylthio)-1,5-diphenyl-1H-1,2,4-triazole (Liu *et al.*, 2006); PUFGED: 2-(1,3-benzothiazol-2-ylsulfanyl)-1-phenylethan-

one (Loghmani-Khouzani *et al.*, 2009b); IKAXOI: 6-cyclohexylmethyl-5-ethyl-2-[(2-oxo-2-phenylethyl)sulfanyl]pyrimidin-4(3H)-one (Yan *et al.*, 2011); SILGAW: 2-(benzoylmethylsulfanyl)-6-benzyl-5-isopropylpyrimidin-4(3H)-one (Rao *et al.*, 2007); ETEWOP: 2-(benzoylmethylsulphanyl)-6-methoxy-1H-benzamide (Lynch & McLenaghan, 2004); XEBWEI: 2-(1,3-benzimidazol-2-ylsulfanyl)phenylethanone (Abdel-Aziz *et al.*, 2012); UGITUA: 2-[(4-methoxybenzyl)sulfanyl]-1-phenylethanone (Heravi *et al.*, 2009).

The R–S bond distances for these compounds are similar to those of the studied compounds and they assume a partial double-bond character with the exception of UGITUA where the S atom is bonded to a phenyl ring, suggesting a tendency for delocalization of the electron density through the sulfur atom when the ring has heteroatoms. The S–CH<sub>2</sub> bond distances vary between 1.80 and 1.81 Å with exception of SILGAW (1.79 Å) and ETEWOP (1.82 Å). The supplementary figure also gives information about the distances of the –CH<sub>2</sub> carbon atom to the best plane made up of the atoms of the heterocycles (CH<sub>2</sub> distance). These values were computed in order to evaluate the degree of bending of the S–CH<sub>2</sub> bond with respect to the main plane of the substituted rings. There are two main groups of compounds, one in which the distance is shorter than 0.3 Å and the other, which contains the CNH fragment in the heterocyclic ring, in which this distance is greater than 1.2 Å. As noted above, the sp<sup>3</sup> character of the β-carbon atom of the ethanone fragment may also direct the relative positions of the acetophenone residue out of the main plane constituted by the substituted heteroaromatic ring. This is the case for SILGAW and IKAXOI. Thus, despite the small sample size, there is a wide range of adopted conformations.

**Figure 10**

Compound (5): the simple C4 chain formed by the N9–H9···O64 weak hydrogen bond. This chain extends along the  $b$  axis and is generated by the  $n$ -glide plane at (0,  $\frac{1}{4}$ , 0). Symmetry codes: (i)  $x - \frac{1}{2}, -y + \frac{1}{2}, -z - \frac{1}{2}$ ; (ii)  $x - \frac{1}{2}, -y + \frac{1}{2}, -z + \frac{1}{2}$ . H atoms not involved in the hydrogen bonding are omitted.

#### 5. Synthesis and crystallization

The 6-mercaptopurine derivatives (1)–(5) were obtained in moderate yields by a two-step synthetic strategy. Firstly, 6-mercaptopurine was alkylated using diverse monobromide acetophenone derivatives in DMF/potassium carbonate medium at room temperature (Lambertucci, *et al.* 2009). After

Computer programs: *CrystalClear-SM Expert* (Rigaku, 2012), *CrysAlis PRO* (Agilent, 2014), *SHELXT* (Sheldrick, 2015a), *ShelXle* (Hübschle *et al.*, 2011), *SHELXL2014* (Sheldrick, 2015b), *OSCAIL* (McArdle *et al.*, 2004), *Mercury* (Macrae *et al.*, 2006), and *PLATON* (Spek, 2009).

thiol alkylation, the purine nucleus was acylated in position 9 with acetic anhydride in triethylamine and anhydrous DMF

for (1)–(4) under an argon atmosphere at room temperature (Masai, *et al.* 2002). All compounds were recrystallized from

dichloromethane solution: 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(3-methoxyphenyl)ethan-1-one (**1**): overall yield: 48%; m.p. 432–435 K; 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-methoxyphenyl)ethan-1-one (**2**): overall yield: 17%; m.p. 460–463 K; 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-chlorophenyl)ethan-1-one (**3**): overall yield: 26%; m.p. 453–457 K; 2-[(9-acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-bromophenyl)ethan-1-one (**4**): overall yield: 10%; m.p. 449–451 K; 1-(3-methoxyphenyl)-2-[(9*H*-purin-6-yl)sulfanyl]ethan-1-one (**5**): overall yield: 55%; m.p. 461–464 K.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 12. H atoms were treated as riding atoms with C—H(aromatic), 0.95 Å, with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ , C—H<sub>2</sub>(methylene), 0.99 Å, with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ , C—H(methyl) 0.98 Å with  $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$  and in (**5**) only, N—H, 0.88 Å, with  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ . The positions of the methyl groups were checked on a final difference map as was that of the N—H hydrogen atom in (**5**). In (**4**), the high difference map peaks were associated with the Br atom.

## Acknowledgements

The authors thank the staff at the National Crystallographic Service, University of Southampton, for the data collection, help and advice (Coles & Gale, 2012) and the Foundation for Science and Technology (FCT) of Portugal (QUI/UI0081/2015) for financial support. FC (grant SFRH/BPD/74491/2010) is supported by FCT, POPH and QREN.

$Z = 4$	$0.17 \times 0.07 \times 0.01 \text{ mm}$

#### Data collection

Rigaku AFC12 (Right) diffractometer	20144 measured reflections 3450 independent reflections
Radiation source: Rotating Anode	2817 reflections with $I > 2\sigma(I)$
Detector resolution: 28.5714 pixels $\text{mm}^{-1}$	$R_{\text{int}} = 0.089$
profile data from $\omega$ -scans	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.8^\circ$
Absorption correction: multi-scan ( <i>CrystalClear-SM Expert</i> ; Rigaku, 20112)	$h = -9 \rightarrow 9$
$T_{\text{min}} = 0, T_{\text{max}} = 1.000$	$k = -33 \rightarrow 34$
	$l = -10 \rightarrow 10$

#### Refinement

Refinement on $F^2$	219 parameters
Least-squares matrix: full	0 restraints
$R[F^2 > 2\sigma(F^2)] = 0.053$	Hydrogen site location: inferred from
$wR(F^2) = 0.148$	neighbouring sites
$S = 1.05$	H-atom parameters constrained
3450 reflections	

$$w = 1/[\sigma^2(F_o^2) + (0.0878P)^2 + 0.318P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.002$

$$\Delta\rho_{\max} = 0.81 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.51 \text{ e } \text{\AA}^{-3}$$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

(2) 2-[(9-Acetyl-9*H*-purin-6-yl)sulfanyl]-1-(4-methoxyphenyl)ethan-1-one*Crystal data*

$C_{16}H_{14}N_4O_3S$   
 $M_r = 342.37$   
Monoclinic,  $P2_1/c$   
 $a = 5.9920 (3) \text{ \AA}$   
 $b = 9.9795 (5) \text{ \AA}$   
 $c = 24.9907 (13) \text{ \AA}$   
 $\beta = 95.977 (5)^\circ$   
 $V = 1486.25 (13) \text{ \AA}^3$   
 $Z = 4$

$F(000) = 712$   
 $D_x = 1.530 \text{ Mg m}^{-3}$   
Mo  $K\alpha$  radiation,  $\lambda = 0.71073 \text{ \AA}$   
Cell parameters from 5825 reflections  
 $\theta = 2.2\text{--}25.0^\circ$   
 $\mu = 0.24 \text{ mm}^{-1}$   
 $T = 100 \text{ K}$   
Plate, colourless  
 $0.05 \times 0.04 \times 0.01 \text{ mm}$

*Data collection*

Rigaku AFC12 (Right)  
diffractometer  
Radiation source: Rotating Anode, Rotating  
Anode  
Confocal mirrors, HF Varimax monochromator  
Detector resolution: 28.5714 pixels  $\text{mm}^{-1}$   
profile data from  $\omega$ -scans  
Absorption correction: multi-scan  
(*CrysAlis PRO*; Agilent, 2014)

$T_{\min} = 0.439$ ,  $T_{\max} = 1.000$   
15437 measured reflections  
2619 independent reflections  
1852 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.106$   
 $\theta_{\max} = 25.0^\circ$ ,  $\theta_{\min} = 2.2^\circ$   
 $h = -7 \rightarrow 6$   
 $k = -11 \rightarrow 11$   
 $l = -29 \rightarrow 29$

*Refinement*

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.048$   
 $wR(F^2) = 0.116$   
 $S = 1.02$   
2619 reflections  
219 parameters  
0 restraints

Hydrogen site location: inferred from  
neighbouring sites  
H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0492P)^2 + 0.3956P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.30 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.36 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

*Data collection*

Rigaku AFC12 (Right) diffractometer	18353 measured reflections 3291 independent reflections
Radiation source: Rotating Anode	2677 reflections with $I > 2\sigma(I)$
Detector resolution: 28.5714 pixels $\text{mm}^{-1}$	$R_{\text{int}} = 0.050$
profile data from $\omega$ -scans	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.7^\circ$
Absorption correction: multi-scan	$h = -7 \rightarrow 7$
<i>CrystalClear-SM Expert</i> (Rigaku, 20112)	$k = -12 \rightarrow 12$
$T_{\text{min}} = 0.809, T_{\text{max}} = 1.000$	$l = -31 \rightarrow 31$

*Refinement*

Refinement on $F^2$	3291 reflections
Least-squares matrix: full	209 parameters
$R[F^2 > 2\sigma(F^2)] = 0.035$	0 restraints
$wR(F^2) = 0.092$	Hydrogen site location: inferred from
$S = 1.02$	neighbouring sites

H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0466P)^2 + 0.5802P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.34 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

0 restraints

Hydrogen site location: inferred from  
neighbouring sites  
H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.1178P)^2 + 0.358P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 2.91 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.92 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

#### Crystal data

$C_{14}H_{12}N_4O_2S$	$F(000) = 624$
$M_r = 300.34$	$D_x = 1.487 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, $\lambda = 0.71075 \text{ \AA}$
$a = 7.6683 (5) \text{ \AA}$	Cell parameters from 16870 reflections
$b = 21.8004 (15) \text{ \AA}$	$\theta = 2.5\text{--}27.5^\circ$
$c = 8.4131 (5) \text{ \AA}$	$\mu = 0.25 \text{ mm}^{-1}$
$\beta = 107.507 (2)^\circ$	$T = 100 \text{ K}$
$V = 1341.29 (15) \text{ \AA}^3$	Block, colourless
$Z = 4$	$0.17 \times 0.12 \times 0.07 \text{ mm}$

#### Data collection

Rigaku AFC12 (Right) diffractometer	17441 measured reflections
Radiation source: Rotating Anode	3063 independent reflections
Detector resolution: 28.5714 pixels $\text{mm}^{-1}$	2799 reflections with $I > 2\sigma(I)$
profile data from $\omega$ -scans	$R_{\text{int}} = 0.060$
Absorption correction: multi-scan <i>(CrystalClear-SM Expert; Rigaku, 2012)</i>	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.7^\circ$
$T_{\text{min}} = 0.724, T_{\text{max}} = 1.000$	$h = -9 \rightarrow 9$
	$k = -28 \rightarrow 28$
	$l = -10 \rightarrow 10$

#### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.033$	$w = 1/[\sigma^2(F_o^2) + (0.055P)^2 + 0.4055P]$
$wR(F^2) = 0.093$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\text{max}} = 0.001$
3063 reflections	$\Delta\rho_{\text{max}} = 0.30 \text{ e \AA}^{-3}$
191 parameters	$\Delta\rho_{\text{min}} = -0.37 \text{ e \AA}^{-3}$
0 restraints	

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
