## Crystal structure of 2,2'-bipyrrole

Christopher A. Michaels, ${ }^{\text {a }}$ Lev N. Zakharov ${ }^{\text {b }}$ and Ashley N. Lamm ${ }^{\text {a }}$

${ }^{\text {a }}$ Department of Chemistry and Biochemistry, Eastern Washington University, Science 226, Cheney, WA 99004, USA, and ${ }^{\text {b }}$ Department of Chemistry, 1253 University of Oregon, Eugene, Oregon 97403, USA. *Correspondence e-mail: alamm@ewu.edu

The complete molecule of the title compound, $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{~N}_{2}$, is generated by a crystallographic center of symmetry. In the crystal, short $\mathrm{N}-\mathrm{H} \cdots \pi[\mathrm{H} \cdots \pi=$ 2.499 (19) $\AA$ ] interactions link the molecules into a herringbone structure.

## 1. Chemical context

Bipyrrole, $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{~N}_{2}$, has been studied extensively over the years: the first reported synthesis was in 1962 (Rapoport \& Castagnoli, 1962). The bipyrrole core occurs in naturally occurring compounds such as prodigiosin (Wasserman et al., 1960). Functionalized bipyrroles have been shown to have anti-cancer activity (Manderville, 2001). Corrole rings contain a bipyrrole segment in the macrocycle (Aviv-Harel \& Gross, 2009). Herein, we report on the crystal structure of the title compound, (I), synthesized by the oxidative coupling of pyrrole.

## 2. Structural commentary

The complete molecule of (I) is generated by a crystallographic center of symmetry (Fig. 1), and therefore the pyrrole rings are exactly parallel and the $\mathrm{N}-\mathrm{H}$ groups face in opposite directions. The C2-C3 bond in (I) is 1.4151 (19) $\AA$, versus the equivalent bond in pyrrole, which has a length of 1.423 (3) $\AA$. The double bonds $\mathrm{C} 1=\mathrm{C} 2$ and $\mathrm{C} 3=\mathrm{C} 4$ in (I) are 1.3635 (19) and 1.3767 (17) $\AA$, respectively, versus the doublebond length in pyrrole of $1.357 \AA$. The shortening of the $\mathrm{C} 2-$ C 3 bond and the lengthening of the adjacent $\mathrm{C}=\mathrm{C}$ double bonds in (I) compared to pyrrole is consistent with stronger intermolecular interactions (see below).

## 3. Supramolecular features

In the crystal of (I), the molecules adopt an edge-to-face orientation: the distance between the $\mathrm{N}-\mathrm{H}$ group and the centroid of the adjacent pyrrole ring generated by the $2_{1}$ screw axis is 2.499 (19) $\AA$ (Table 1). A survey of the Cambridge Crystallographic Database (Groom et al., 2016) showed that

The molecular structure of the title compound with displacement ellipsoids drawn at the $50 \%$ probability level. [Symmetry code: (i) $1-x$, $2-y,-z$.]

Table 1
Hydrogen-bond geometry ( $\left(\AA,{ }^{\circ}\right)$.
Cg is the centroid of the $\mathrm{N} 1 / \mathrm{C} 1-\mathrm{C} 4$ ring.

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{~N} 1-\mathrm{H} 1 N \cdots C g 1^{\mathrm{i}}$ | $0.907(16)$ | $2.499(19)$ | $3.2275(12)$ | $138.1(13)$ |

Symmetry code: (i) $-x+1, y+\frac{1}{2},-z+\frac{1}{2}$.
the average $\mathrm{N}-\mathrm{H} \cdots \pi$ separation is $2.804 \AA$ and 13 out of 156 interactions ( $8.3 \%$ ) had an $\mathrm{N}-\mathrm{H} \cdots \pi$ interactions shorter than $2.5 \AA$. The crystal packing in (I) is similar to that of pyrrole, which has the same intermolecular $\mathrm{N}-\mathrm{H} \cdots \pi$ interactions (Goddard et al., 1997). The edge-to-face interaction has been suggested to be a stabilizing factor in protein structures and polypeptides have been observed to have a separation of $2.42 \AA$ from the $\mathrm{N}-\mathrm{H}$ group to the phenyl ring

Figure 2
View of the $\mathrm{N}-\mathrm{H} \cdots \pi$ interactions and packing in the title compound.
(Steiner, 1998) and calculations corroborate these data (Levitt Perutz, 1988). It is notable that the $\mathrm{N}-\mathrm{H}$ bond of $2,2^{\prime}$-bipyrrole points almost directly at the midpoint of the $\mathrm{C} 2-\mathrm{C} 3$ bond. In the extended structure, the molecules are orientated by edge-to-face interactions generating a herringbone pattern, see Fig. 2.

## 4. Database survey

There are very few examples of similar compounds available in the literature. Most bipyrroles have carbonyl groups as substituents on the pyrrole ring in which the $\mathrm{N}-\mathrm{H}$ group forms hydrogen bonds with the oxygen atom of the carbonyl (Okawara et al., 2015). So far as we are aware, there are no bipyrrole examples that exhibit the same packing and hydrogen-bonding pattern as the title compound; the closest example is pyrrole itself (Goddard et al., 1997).

## 5. Synthesis and crystallization

$230 \mu \mathrm{l}$ ( 3.3 mmol ) of pyrrole was added to dichloromethane $(10 \mathrm{ml})$, degassed and cooled to 195 K . Trimethylsilyl bromide ( $290 \mu \mathrm{l}, 2.2 \mathrm{mmol}$ ) and phenyl iodine trifluoracetic acid ( $477 \mathrm{mg}, 1.1 \mathrm{mmol}$ in 1 ml dichloromethane) were added quickly to the cooled reaction. The mixture was stirred for 1 h then extracted with a saturated sodium bicarbonate solution and purified by column chromatography with a pentane/ethyl acetate (1:1) solution. Colourless blocks of (I) were obtained 7 d later by slow evaporation from an ethyl acetate solution.

$\Delta \rho_{\max }=0.18$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.16$ e $\AA^{-3}$

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
