#### Abstract

A novel series of peptidomimetic aldehydes was designed and synthesized to target 3 C protease ( $3 \mathrm{C}^{\text {pro }}$ ) of enterovirus 71 (EV71). Most of the compounds exhibited high antiviral activity, and among them, compound $18 p$ demonstrated potent enzyme inhibitory activity and broad-spectrum antiviral activity on a panel of enteroviruses and rhinoviruses. The crystal structure of EV71 $3 C^{\text {pro }}$ in complex with $\mathbf{1 8 p}$ determined at a resolution of $1.2 \AA$ revealed that $\mathbf{1 8 p}$ covalently linked to the catalytic Cys 147 with an aldehyde group. In addition, these compounds also exhibited good inhibitory activity against the $3 \mathrm{CL}^{\text {pro }}$ and the replication of severe acute respiratory syndrome  coronavirus 2 (SARS-CoV-2), especially compound $18 \mathrm{p}\left(\mathrm{IC}_{50}=\right.$ $0.034 \mu \mathrm{M}, \mathrm{EC}_{50}=0.29 \mu \mathrm{M}$ ). According to our previous work, these compounds have no reasons for concern regarding acute toxicity. Compared with AG7088, compound 18p also exhibited good pharmacokinetic properties and more potent anticoronavirus activity, making it an excellent lead for further development.

## INTRODUCTION

Enterovirus 71 (EV71) belongs to the enterovirus genus of the picornaviridae family, and the genome of EV71 is composed of a single-stranded positive-sense RNA. To the best of our knowledge, EV71 is not only the primary pathogen of hand, foot, and mouth disease (HFMD) but also closely associated with neurological syndromes such as severe encephalitis and aseptic meningitis, and these diseases caused by the EV71 have become a worldwide health problem. Especially, young children are more susceptible to be infected by the enterovirus. ${ }^{1}$ However, to date, there are no approved drugs to prevent or treat the associated diseases. ${ }^{2}$ Considering the detriment of HFMD and the central neurological syndromes in children, the development of effective antiviral drugs is urgently needed.

The genome of enterovirus 71 encodes a polyprotein precursor, which is cleaved by the 3 C protease ( $\left.3 \mathrm{C}^{\text {pro }}\right)$ and 2 A protease ( $2 \mathrm{~A}^{\text {pro }}$ ) into structural proteins and nonstructural proteins, of which the $3 \mathrm{C}^{\text {pro }}$ is responsible for most of the cleavages. The $3 \mathrm{C}^{\text {pro }}$ of enteroviruses and rhinoviruses (RV) is essential for viral replication, and it not only shared a high degree of homology at an amino acid level but also contained a Cys-HisAsp/Glu catalytic triad. In addition, the $3 C^{\text {pro }}$ is an exceptional cysteine protease with unique folding and catalytic mechanism, and a Gln is almost required in the P1 position of the substrates.

As far as we know, none of the known human proteases possessed a similar cleavage specificity, which makes $3 C^{\text {pro }}$ become a highly prospective target for developing broadspectrum drugs. ${ }^{3,4}$ Recent efforts in drug discovery also furnished several inhibitors against the EV71 3C ${ }^{\text {pro }}$ (Figure 1). Those peptidomimetic compounds with a warhead in $\mathrm{P} 1^{\prime}$ and a lactam ring in P1 could be briefly divided into reversible and irreversible inhibitors according to their binding modes. Compounds $\mathbf{1 - 6}$ are reversible inhibitors, among which compounds 1, 2, 4, and 5 are covalent reversible inhibitors, while $\mathbf{3}$ and $\mathbf{6}$ are noncovalent inhibitors. Those compounds exhibited good anti-EV71 activity with $\mathrm{EC}_{50}$ values in the range of $0.009-3.7 \mu \mathrm{M}$, while the broad-spectrum antiviral activity and the drug-like properties were rarely evaluated. ${ }^{5}$ Rupintrivir (AG7088) ${ }^{5 \mathrm{a}}$ was reported to have the excellent antivirus activity against EV71 with an $\mathrm{EC}_{50}$ value of $0.009 \mu \mathrm{M}$ and has entered clinical trials as a protease inhibitor targeting rhinovirus $3 \mathrm{C}^{\text {pro }}$,

but its activity against coronaviruses is weak. Compounds $\mathbf{1}^{5 b}$ and $\mathbf{2}^{5 c, \mathrm{~d}}$ showed good anti-EV71 activity, and the selectivity of compounds $3^{\text {5e }}$ and $4^{\text {5f }}$ toward other common mammalian proteases was high, but their pharmaceutical properties were not satisfied; no more research progresses have been reported. Our compound ( $5^{5 g}$ ) exhibited broad-spectrum antiviral activity, but its activity against EV71 was weak. As reported, the plasma stability of compounds $6^{5 \mathrm{~h}}$ and $7^{5 \mathrm{i}}$ was impressive, while their pharmacokinetic properties needed to be further improved. Although many inhibitors with different warheads had been reported, there was still no effective drug on the market. With those in mind, novel broad-spectrum antiviral inhibitors with good pharmacokinetic properties and safety need to be designed.

## RESULTS AND DISCUSSION

Compound Design. AG7088 has potent anti-EV71 activity $\left(\mathrm{EC}_{50}=0.009 \mu \mathrm{M}\right)$, so we analyzed the crystal structure of EV71 $3 C^{\text {pro }}$ with AG7088 (Figure 2) for our compound's design. ${ }^{6}$ The results demonstrate that $\alpha, \beta$-unsaturated ester of AG7088 forms a covalent linkage with the Cys 147 residue in the S1' subsite of

Figure 2. X-ray structure of the surface representation of EV71 3C ${ }^{\text {pro }}$ (PDB ID: 4GHT) complexed with the AG7088 (yellow).
the EV71 $3 \mathrm{C}^{\text {pro }}$, which is the key point for maintaining the antivirus activity. The ( $S$ ) - $\gamma$-lactam ring at P1 position forms hydrogen bonds with the crucial residues including Thr 142 and His161 in the S1 subsite, and the substituted phenyl group at the P2 position occupies the S2 subsite well. The complex also revealed that the isopropyl in the P3 moiety is solvent-exposed, and the P4 moiety forms hydrogen bonds with Gly164, Asn145, and Ser128. ${ }^{\text {6h }}$ Unfortunately, the $\alpha, \beta$-unsaturated ester is easily hydrolyzed, the plasma stability of the AG7088 is poor, and its half-life in rat plasma is less than 2 min ; in addition, AG7088 was inactive to the SARS-CoV 3CL protease ( $\mathrm{IC}_{50}>100 \mu \mathrm{M}$ ). ${ }^{7} \mathrm{We}$ want to overcome this shortcoming of AG7088 and obtain some novel compounds.

In our previous work, peptidomimetic $\alpha$-ketoamides (compound 5) exhibited broad-spectrum antivirus activity. ${ }^{5 g}$ Former reports showed that compound 1 also had good anti-EV71 activity $\left(\mathrm{EC}_{50}=0.096 \mu \mathrm{M}\right)$. After analyzing the crystal structure of AG7088 with EV71 $3 \mathrm{C}^{\text {pro }}$ and comparing the structure of compound 1, compound 5, and AG7088, we found that they shared similar important key pharmacophore fragments with a warhead and ( $S$ ) $-\gamma$-lactam ring. In this core structure, the warheads could be covalently linked to Cys147, and the lactam ring could interact with the crucial residues, and we envisioned AG7088 showed better antivirus activity might benefit from the additional interaction at the P3 and P4 position. When we embarked on designing the novel compounds (Figure 3), the key pharmacophore fragments in compounds 1, 5, and AG7088 were extracted, and then some common warheads were investigated to get compounds 19a and 19b. Subsequently, we introduced some heterocyclic moieties into the P3 position to obtain the corresponding peptidomimetic aldehydes $\mathbf{1 8 b} \mathbf{- 1 8 p}$. In a second approach, a valine moiety was introduced in the P3 position to keep the chain length similar to AG7088, and different heterocycles were investigated in the P4 position to get compounds 26a-26e.

## Scheme 1. Synthesis Procedure of Target Compounds ${ }^{a}$

${ }^{a}$ Reagents and conditions: (a) LiHMDS, THF, $-78{ }^{\circ} \mathrm{C}$; (b) $\mathrm{NaBH}_{4}, \mathrm{CoCl}_{2}, 0^{\circ} \mathrm{C}$; (c) $4 \mathrm{M} \mathrm{HCl}, 12 \mathrm{~h}$; (d) HATU, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-20{ }^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (e) $4 \mathrm{M} \mathrm{HCl}, 12 \mathrm{~h}$; (f) HATU, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (g) $\mathrm{NaBH}_{4}, \mathrm{CH}_{3} \mathrm{OH}$; (h) Dess-Martin periodinane, $\mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (i) $\mathrm{Ph}_{3} \mathrm{PCH}_{2} \mathrm{COOR}_{4}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}$.

Chemistry. The synthetic routes and chemical structures of the compounds ( $\mathbf{1 9 a}, \mathbf{1 9 b}$, and $\mathbf{1 8 b} \mathbf{- 1 8 p}$ ) are shown in Scheme

1. The starting material 8 was obtained from commercial suppliers and used without further purification, and the key

## Scheme 2. Synthesis Procedure of Target Compounds ${ }^{a}$

${ }^{a}$ Reagents and conditions: (a) HATU, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (b) $4 \mathrm{M} \mathrm{HCl}, 12 \mathrm{~h}$; (c) HATU, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (d) $\mathrm{NaBH}_{4}$, $\mathrm{CH}_{3} \mathrm{OH}$; (e) Dess-Martin Periodinane, $\mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$.
intermediate $11^{5 e}$ was synthesized by following the literature. The intermediate $\mathbf{1 3}$ was synthesized starting from the amino 11 and $N$-( $t$-butoxycarbonyl)-L-phenylalanine 12. After the $t$ butoxycarbonyl group was removed from 13 by 4 M HCl in dioxane, the intermediate 14 was obtained. A subsequent coupling reaction between compound 14 and the corresponding acids $\mathbf{1 5}$ resulted in esters $16 a-16 p$. The peptidomimetic aldehydes $\mathbf{1}$ and $\mathbf{1 8 b} \mathbf{- 1 8 p}$ were approached via a two-step route, in which the ester derivatives $16 a-16 p$ were first reduced with $\mathrm{NaBH}_{4}$ to generate the primary alcohols $\mathbf{1 7 a}-\mathbf{1 7} \mathbf{p}$, and subsequently, $\mathbf{1 7 a}-17 \mathrm{p}$ were oxidized into aldehydes 1 and 18b-18p with Dess-Martin periodinane (DMP). Finally, compounds 19 a and 19 b were obtained from 1 by the Wittig reaction.

The synthetic procedure of compounds 26a-26e was shown in Scheme 2. Compound 21 was obtained via a condensation reaction between the same intermediate 14 with N - $(t-$ butoxycarbonyl)-L-valine 20, and then, the $t$-butoxycarbonyl group of $\mathbf{2 1}$ was removed by 4 M HCl in dioxane to obtain 22 . Subsequently, compound 22 was coupled with the corresponding acid 23 to afford esters $24 \mathbf{a}-\mathbf{2 4 e}$. After completion of a reduction of the esters $\mathbf{2 4 a} \mathbf{- 2 4 e}$, the desired products (25a25e) were reoxidized by DMP to obtain the final products 26a26e.

Structure-Activity Relationship of the Compounds. All the synthesized compounds were tested for inhibitory activity of EV71 3C ${ }^{\text {pro }}$ and antiviral activity of EV71, and results are summarized in Table 1 and Table 2.

Modification on $\mathbf{R}_{1}$ and $\mathbf{R}_{2}$. Structural modifications on $\mathrm{R}_{1}$ and $R_{2}$ were first conducted, and a number of derivatives have been designed, synthesized, and biologically evaluated. The results were summarized in Table 1, and two compounds (compound 1 and AG7088) were used as references in this
work. $\mathrm{IC}_{50}$ values of compound 1 were inconsistent with previous reports, which might be caused by a difference in enzyme concentration. ${ }^{5 \mathrm{~b}}$ These data indicated that the enzyme inhibitory activity of peptidomimetic aldehyde (compound $\mathbf{1}$, $\mathrm{IC}_{50}=4.57 \pm 0.27 \mu \mathrm{M}$ ) was weaker than the compounds, in which $\alpha, \beta$-unsaturated ester was defined as the warhead (compounds 19a and 19b), while compound 1 displayed better anti-EV71 activity $\left(\mathrm{EC}_{50}=0.10 \pm 0.01 \mu \mathrm{M}\right)$ than $\alpha, \beta$ unsaturated methyl ester 19a $\left(\mathrm{EC}_{50}=1.21 \pm 0.14 \mu \mathrm{M}\right)$ and $\alpha, \beta$-unsaturated benzyl ester $19 b\left(\mathrm{EC}_{50}=3.10 \pm 0.09 \mu \mathrm{M}\right)$, and the antiviral results showed that a small group might be more suitable in $\mathrm{P1}^{\prime}$. Based on the antiviral activity, an aldehyde was selected as a new warhead for further optimization. When aldehyde on $R_{2}$ was incorporated and the $R_{1}$ moiety was replaced with heterocyclic motifs, most of the target compounds ( $\mathbf{1 8 b} \mathbf{- 1 8 1}, \mathbf{1 8 n}$, and 18 p ) showed better $3 \mathrm{C}^{\text {pro }}$ inhibitory activity $\left(\mathrm{IC}_{50}<4.0 \mu \mathrm{M}\right)$ than compound $1\left(\mathrm{IC}_{50}=4.57 \mu \mathrm{M}\right)$, indicating that the introduction of the heterocyclic ring in P3 might be able to form additional interactions with the S 4 subsite to improve the inhibitory activity of $3 \mathrm{C}^{\text {pro }}$. The inhibitory activity of compound 11 m was decreased, which might be due to the fact that the nitrogen atom in this compound could not form an additional interaction. As we know, the antiviral activity is a result caused by multiple factors, which was related not only to enzyme inhibitory activity but also the other properties such as permeability. So the $\mathrm{EC}_{50}$ values deserved further discussion. The enzyme inhibitory activity of monocyclic moietysubstituted derivatives ( $\mathbf{1 8 b}, \mathbf{1 8 c}$ ) was increased, while a lower antiviral activity was observed when comparing to compound $\mathbf{1}$. Those results indicated that monocyclic moieties might not be a good choice on $R_{1}$, and then bicyclic heterocycles were investigated. The anti-EV71 activities of compounds with heterocyclic acene moieties $\mathbf{1 8 d} \mathbf{- 1 8 h}$ were decreased, and the

${ }^{a}$ Each value represented the average results from three independent experiments.
introduction of 7-bromoimidazo[1,2-a]pyridine (compound 18i) also reduced the anti-EV71 activity. Subsequently, benzoheterocycles were introduced on $\mathrm{R}_{1}(\mathbf{1 8 j} \mathbf{- 1 8 p})$, and compounds $\mathbf{1 8 j}, \mathbf{1 8 k}$, and $\mathbf{1 8 m}$ had similar activities compared to compound 1. The introduction of methyl on quinoxaline (181) reduced the antiviral activity; when $R_{1}$ was replaced with a substituted quinoline (18n), the anti-EV71 activity was also increased. It was noteworthy that compound $180\left(\mathrm{EC}_{50}=0.07\right.$ $\pm 0.01 \mu \mathrm{M})$ showed better anti-EV71 activity than compound $\mathbf{1}$, albeit the cytotoxicity of these compounds was slightly increased ( $\mathrm{CC}_{50}=16.4 \mu \mathrm{M}$ ). The 2-indole scaffold was incorporated, and the activity of 18 p against EV71 $\left(\mathrm{EC}_{50}=0.030 \pm 0.002 \mu \mathrm{M}\right)$ was increased. The discrepancy of the activities between compounds including $\mathbf{1 8 h}$ and $\mathbf{1 8 j}$ with $\mathbf{1 8 p}$ indicated that the NH moiety in the 2 -indole scaffold was vital for maintaining the anti-EV71 activity.

Modification on the $\mathbf{R}_{\mathbf{3}}$ Position. On the other hand, as showed in Table 2, structural modifications had been continued

Table 2. Enzyme Inhibitory Activity and anti-EV71 Activities of Peptidomimetic Aldehydes with $\mathrm{R}_{3}$ Modifications ${ }^{a}$

| Compd. | $\mathbf{R}_{3}$ | $\mathrm{IC}_{\mathbf{5 0}}(\boldsymbol{\mu} \mathbf{M})$ | $\mathrm{EC}_{50}(\mu \mathrm{M})$ | $\mathrm{CC}_{50}(\mu \mathrm{M})$ |
| :---: | :---: | :---: | :---: | :---: |
| 26a |  | $6.73 \pm 0.60$ | $0.090 \pm 0.020$ | >100 |

${ }^{a}$ Each value represented the average results from three independent experiments.
by introducing a valine motif at the P3 position, and most of the target compounds (26a-26e) showed good enzyme inhibitory activities (ranging from $2.43 \mu \mathrm{M}$ to $7.49 \mu \mathrm{M}$ ), while the inhibitory activities of those compounds were weaker than AG7088 ( $\mathrm{IC}_{50}=1.89 \mu \mathrm{M}$ ). We proposed the reason might be that, after replacing the carbon atom in AG7088 with a nitrogen atom, the conformation of those compounds (26a-26e) changes a lot, which made those compounds unable to occupy the binding pocket very well, and $\alpha, \beta$-unsaturated ester showed more potent inhibitory activity against $3 C^{\text {pro }}$ than aldehyde. The results of antiviral activities showed that the introduction of 5-methyl-1,2-oxazole and benzoheterocycles moiety on $\mathrm{R}_{3}$ made the anti-EV71 activity of the corresponding compounds (26a26d) comparable to compound 1. Especially when the quinoline group was introduced into the $\mathrm{R}_{3}$ position, compound 26d showed good activity ( $\mathrm{EC}_{50}=0.043 \pm 0.010 \mu \mathrm{M}$ ), while the activities of these tripeptide compounds were decreased compared with compound 18 p and AG7088. In addition, compounds $26 d$ and $18 p$ exhibited safety cytotoxicity $\left(\mathrm{CC}_{50}=\right.$ $82.8 \mu \mathrm{M}$ and $\mathrm{CC}_{50}>100 \mu \mathrm{M}$, respectively).

Crystal Structure of EV71 3C ${ }^{\text {pro }}$ in Complex with 18 p . To understand the binding mode of these inhibitors with the protease, the complex structure of EV71 3C ${ }^{\text {pro }}$ bound with $\mathbf{1 8 p}$ was determined at a resolution of $1.2 \AA$. Compound 18 p bound into the substrate-binding site at the surface of the protease and occupied S1, S2, and S4 subsites (Figure 4A). At the S1' subsite, the aldehyde group of $\mathbf{1 8 p}$ covalently linked to the catalytic Cys147 of the protease (Figure 4B,C). In addition to this covalent bond, the oxygen atom of the aldehyde group established H -bonds with the side chain of catalytic His 40 directly and the NH of the Gly 145 main chain (part of the oxyanion hole) through a water molecule (Figure 4C). The (S)-$\gamma$-lactam ring of $\mathbf{1 8 p}$ perfectly engaged within the S 1 subsite. The oxygen atom of the $(S)-\gamma$-lactam ring formed H -bonds with the side chains of His161 and Thr142, while the nitrogen atom of

Figure 4. Crystal structure of the EV71 $3 \mathrm{C}^{\text {pro }}$ in complex with $\mathbf{1 8 p}$. (A) The binding mode of $\mathbf{1 8 p}$ at the substrate-binding site of the EV71 $3 C^{\text {pro }}$ (PDB code: 7DNC). The EV71 $3 \mathrm{C}^{\text {pro }}$ was shown as a molecular surface, and 18p was shown by light orange sticks. (B) 2 Fo-Fc density maps contoured at $2.0 \sigma$ are shown for 18 p and C147. (C) Interactions of $\mathbf{1 8 p}$ with the surrounding residues revealed by the crystal structure. Residues are shown as light blue sticks, and H-bonds are represented by black dashed lines.
the $(S)-\gamma$-lactam ring formed a H -bond with the main chain of Thr142. The benzyl ring of $\mathbf{1 8 p}$ occupied the S2 subsite by forming hydrophobic interactions with His40, Glu71, and Leu127. The indole group of $\mathbf{1 8 p}$ fitted into the S 4 subsite and donated a H -bond to the main chain of Gly164. In addition, the amide bonds of $\mathbf{1 8 p}$ also participated in binding by establishing H-bonds with Ile162 and Gly164 directly and with Ser128 through a water molecule (Figure 4C).

A structure overlay of the EV71 $3 \mathrm{C}^{\text {pro }} \mathbf{- 1 8 p}$ and the EV71 $3 C^{\text {pro }}$-AG7088 complexes revealed that these two compounds adopted similar binding modes (Figure S1A). The difference mainly lied in the interactions with the $\mathrm{S1}^{\prime}$ and S 4 subsites. AG7088 covalently bound to the catalytic Cys 147 with its $\alpha, \beta$ unsaturated ketone, while the aldehyde group of $\mathbf{1 8 p}$ was used to covalently link to the catalytic Cys147. Simultaneously, the oxygen atom of the aldehyde group participated in forming multiple H -bonds with the surrounding residues including the catalytic His 40 . At the S4 subsite, the indole ring of $\mathbf{1 8 p}$ flipped up and established a shorter H-bond ( 2.9 Å) with Gly164 compared to the H-bond ( $3.1 \AA$ ) between AG7088 and Gly164. In addition, a new H -bond was formed between the amide bond
of $\mathbf{1 8 p}$ and Ser128, mediated by a water molecule (Figure S1B, C).

Activity on a Panel of Enteroviruses and Rhinoviruses.
Considering that the 3 C proteases are conserved between different viruses, four compounds ( $\mathbf{1}, \mathbf{1 8 p}, \mathbf{1 9 a}$, and $\mathbf{2 6 b}$ ) were further tested against a panel of relevant enteroviruses and rhinoviruses, and results were summarized in Table 3. The results demonstrated that the derivatives with aldehyde warhead had potent broad-spectrum antiviral activities. Compound 1 showed better broad-spectrum antiviral activity than the $\alpha, \beta$ unsaturated ester 19a. Additionally, the dipeptide compound 18p was proved to have more efficacy than the tripeptide compound 26b. Besides, compounds 18p also exhibited excellent anti-EV68 activity ( $\left.\mathrm{EC}_{50}=0.03 \pm 0.01 \mu \mathrm{M}\right)$, and compounds 18 p and 26b also exhibited high anti-CoxA21 activity $\left(\mathrm{EC}_{50}=0.43 \pm 0.11 \mu \mathrm{M}\right.$ and $\mathrm{EC}_{50}=0.51 \pm 0.01 \mu \mathrm{M}$, respectively), while its antiviral activities against CoxB3 and HRV were weak, which might be caused by the difference in substrate binding pockets (Figure S2). According to these results, compound $\mathbf{1 8 p}$ has a lot of potential to be accessed in a broad-spectrum antiviral drug.

Antiviral Activity on SARS-CoV-2. In late December 2019, an emerged coronavirus called SARS-CoV-2 (severe acute respiratory syndrome coronavirus 2 ), causes the pandemic COVID-19 (coronavirus disease 2019). There are no specific antiviral drugs approved by the FDA except Remdesivir, so the development of more effective antiviral drugs is of great significance. ${ }^{8}$ SARS-CoV-2 is an enveloped, positive-sense, single-stranded RNA virus that belongs to the $\beta$-lineage of the coronavirus. The genome is translated into two polyproteins, and then the polyproteins were cleaved by 3 C -like protease ( $3 \mathrm{CL}^{\text {pro }}$, also named the main protease) and papain-like proteinase ( $\mathrm{PL}^{\text {pro }}$ ). The majority of this proteolytic processing utilizes the 3CL ${ }^{\text {pro }}$, which plays a vital role in SARS-CoV-2's replication. Unlike enterovirus $3 \mathrm{C}^{\text {pro }}$, the active form of the SARS-CoV-2 3CL ${ }^{\text {pro }}$ is a dimer, and it has a catalytic dyad containing cysteine and histidine. ${ }^{9,10}$ As we know, the $3 \mathrm{C}^{\text {pro }}$ of EV71 and 3CL ${ }^{\text {pro }}$ of SARS-CoV-2 share some similarities; for example, both the catalytic sites contain cysteine and histidine, and a glutarnine (Gln) is almost always required in the P1 position of their substrates. In our previous work, we found the active sites of $3 \mathrm{C}^{\text {pro }}$ and $3 \mathrm{CL}^{\text {pro }}$ also are similar and usually composed of four sites: $\mathrm{S}^{\prime}$, S1, S2, and S4. ${ }^{5 \mathrm{~S}, 9 \mathrm{~d}}$ Recently, many inhibitors targeting SARS-CoV-2 3CL ${ }^{\text {pro }}$ have been reported, and most of them shared similar key pharmacophore fragments (warhead and lactam ring) and exhibited good inhibitor activity against $3 \mathrm{CL}^{\text {pro }}$ and replication of SARS-CoV-2 (Figure 5). ${ }^{9 \mathrm{~b}, \mathrm{c}, 11}$ Among them, two peptide inhibitors developed by Pfizer (PF007304814 is a phosphate prodrug of PF-00835231 $)^{11 \mathrm{~b}}$ and our group (compound 29) ${ }^{9 \mathrm{~d}}$ show potent antiviral activity and good safety, and both have entered phase I clinical trials. Our antienterovirus compounds show some similarity to compound

${ }^{a}$ Each value represented the average results from three independent experiments
showed excellent inhibitory activity of $3 \mathrm{CL}^{\text {pro }}\left(\mathrm{IC}_{50}<0.10 \mu \mathrm{M}\right)$, especially when the $\mathrm{IC}_{50}$ value of $\mathbf{1 8 p}$ was $0.034 \mu \mathrm{M}$. However, when the quinoline group was incorporated, the enzyme
inhibitory activities were decreased (18m, 18n, and 26d). In our previous work, the 2 -indole moiety could form an additional H -bond with Glu166 in the S 4 subsite. ${ }^{9 \mathrm{~d}}$ When 2-quinoline and the derivative ( $\mathbf{1 8 m}, \mathbf{1 8 n}$, and $\mathbf{1 8 0}$ ) were introduced, the H bond could not be formed, so this might be the reason for the decrease of inhibitory activity against $3 \mathrm{CL}^{\text {pro }}$. Then, the antiviral activity against SARS-CoV-2 was evaluated, of which six benzoheterocyclic dipeptide compounds exhibited excellent inhibitory activity $\left(\mathrm{EC}_{50}<0.5 \mu \mathrm{M}\right)$, and the $\mathrm{EC}_{50}$ values of $\mathbf{1 8 o}$ and 18 p were $0.25 \mu \mathrm{M}$ and $0.29 \mu \mathrm{M}$, respectively. In addition, the selection index of $\mathbf{1 8 p}(\mathrm{SI}=2786)$ is better than $\mathbf{1 8 o}(\mathrm{SI}=$ 1192). The results showed the inhibitory activities of the tripeptide compounds (26a-26d) were greater than $1 \mu \mathrm{M}$, and the reason might be that the tripeptide compounds showed poor membrane permeability. ${ }^{11}$ Those results indicate the compound $\mathbf{1 8 p}$ also is a good starting point for further optimization as a SARS-CoV-2 inhibitor.

Preliminary Pharmacokinetic (PK) Evaluation of Compounds 18p and 26d. To explore the further druggability of the novel peptide aldehydes, compounds 18 p and $\mathbf{2 6 d}$ were evaluated for their pharmacokinetic properties in mice after intraperitoneal ( $20 \mathrm{mg} / \mathrm{kg}$ ), subcutaneous ( $5 \mathrm{mg} / \mathrm{kg}$ ), and intravenous ( $5 \mathrm{mg} / \mathrm{kg}$ ) administration. As shown in Table 5, compound 18p given intraperitoneally and subcutaneously displayed a much higher area under the curve (AUC) value than that of $\mathbf{2 6 d}$. Compound $\mathbf{1 8 p}$ also displayed a longer half-life $\left(T_{1 / 2}\right)$ of 5.85 h when administrated intravenously. Those results indicate that compound $\mathbf{1 8 p}$ has better PK properties than $\mathbf{2 6 d}$

[^1]to warrant further study. The reason why the bioavailability of compound $\mathbf{1 8 p}$ is greater than $100 \%$ may be due to changes in the clearance rate in different routes of administration, and the clearance rate of $\mathbf{1 8 p}$ is fast by intravenous injection. ${ }^{12}$

## - CONCLUSION

In summary, a series of novel protease inhibitors with an aldehyde warhead was designed, synthesized, and biologically evaluated on EV71 by analyzing the crystal structure of EV71 3C protease with AG7088. Most of the compounds have potent inhibitory activity of $3 \mathrm{C}^{\text {pro }}$ and EV71. The SAR study indicated that the introduction of aldehyde at $\mathrm{P1}^{\prime}$ position presented better antiviral activities than the $\alpha, \beta$-unsaturated ester. Heteroaromatic scaffolds were introduced at the $\mathrm{R}_{1}$ group, and most of the compounds displayed good antiviral activities, especially when $R_{1}$ is an indole moiety ( $\mathbf{1 8 p}$ ). Compound $\mathbf{1 8 p}$ not only has high inhibitory activity of $3 \mathrm{C}^{\text {pro }}$ and EV71 ( $3 \mathrm{C}^{\text {pro }}$ : $\mathrm{IC}_{50}=2.36 \mu \mathrm{M}, \mathrm{EV} 71: \mathrm{EC}_{50}=0.030 \mu \mathrm{M}$ ), but also against EV68 ( $\mathrm{EC}_{50}=0.03 \mu \mathrm{M}$ ), CoxA21 $\left(\mathrm{EC}_{50}=0.43 \mu \mathrm{M}\right)$ and RV-B14-WT $\left(\mathrm{EC}_{50}=0.81 \mu \mathrm{M}\right)$. It also showed moderate activity against CoxB3 $\left(\mathrm{EC}_{50}=4.19 \mu \mathrm{M}\right)$ and RV-A02-WT $\left(\mathrm{EC}_{50}=1.62 \mu \mathrm{M}\right)$ and low toxicity $\left(\mathrm{CC}_{50}>100 \mu \mathrm{M}\right)$. The crystal structure of EV71 $3 \mathrm{C}^{\text {pro }}$ in complex with $\mathbf{1 8} \mathbf{p}$ was also determined at a resolution of 1.2 Å. It showed that $\mathbf{1 8 p}$ fitted into the $\mathrm{S1}^{\prime}, \mathrm{S} 1, \mathrm{~S} 2$, and S 4 sites perfectly and established multiple H -bonds with the surrounding residues including the catalytic His 40 . In addition, the aldehyde group of $\mathbf{1 8 p}$ covalently bound to the catalytic Cys147, which was essential for maintaining the potency of these newly designed inhibitors, and the NH in the indole group formed a hydrogen bond with the main chain of Gly164. Some compounds were further evaluated against $3 \mathrm{CL}^{\text {pro }}$ and SARS-$\mathrm{CoV}-2$, and the $\mathbf{1 8 p}$ also showed excellent inhibitory activity (3CL ${ }^{\text {pro }}: \mathrm{IC}_{50}=0.034 \mu \mathrm{M}$, SARS-CoV-2: $\left.\mathrm{EC}_{50}=0.29 \mu \mathrm{M}\right)$. In addition, this class of compounds also has no reasons for concern regarding acute toxicity. ${ }^{9 \mathrm{~d}}$ Compared with AG7088, compound 18p exhibited good PK properties and more potent anticoronavirus activity, and it is an excellent starting point for further optimization toward a broad-spectrum antiviral drug.

## EXPERIMENTAL SECTION

General Methods. The materials and solvents were purchased from commercial sources and used without further purification. All products were characterized by their NMR and MS spectra. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a 400,500 , or 600 MHz instrument. Compounds were purified by chromatography with silica gel (300-400 mesh). Analytical thin-layer chromatography (TLC) was HSGF 254 ( $0.15-0.2 \mathrm{~mm}$ thickness). Preparative thin-layer chromatography (PTLC) was HSGF 254 ( $0.4-0.5 \mathrm{~mm}$ thickness). High-resolution mass spectra (HRMS) were measured on a Micromass Ultra Q-TOF spectrometer. HPLC analysis of all final compounds was performed on Agilent-1100 HPLC with a binary pump and photodiode array detector (DAD), using an Agilent Extend-C18 column ( $150 \mathrm{~mm} \times 4.6 \mathrm{~mm}, 5$ $\mu \mathrm{m})$. All final compounds were analyzed using $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}=70: 30$ $(\mathrm{v} / \mathrm{v})(0.8 \mathrm{~mL} / \mathrm{min})$, and all of them had an at least $95 \%$ purity.

Synthesis Procedure of Compounds. Synthetic Procedure of Compounds 9-11. The solution of lithium bis(trimethylsilyl)amide (LHMDS) ( $94 \mathrm{~mL}, 1 \mathrm{M}$ in THF) was added dropwise to a solution of N-Boc-L-glutamic acid dimethyl ester (8) ( $12.0 \mathrm{~g}, 43.6 \mathrm{mmol}$ ) in THF $(100 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$; then, the mixture was stirred at $-78^{\circ} \mathrm{C}$ for 1 h . Subsequently, bromoacetonitrile ( $3.24 \mathrm{~mL}, 46.6 \mathrm{mmol}$ ) was added dropwise to the mixture under the temperature of $-78^{\circ} \mathrm{C}$, and the reaction was kept at $-78^{\circ} \mathrm{C}$ for an additional 4 h . After the reactant was consumed, the reaction was quenched by $\mathrm{NH}_{4} \mathrm{Cl}(40 \mathrm{~mL})$. The reaction mixture was warm up to room temperature and extracted with ethyl acetate $(50 \mathrm{~mL} \times 3)$. The organic layers were concentrated and
purified by flash column chromatography (petroleum ether/ethyl acetate $=4: 1)$ to give product $9(7.58 \mathrm{~g}, 55 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 5.11(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.38(\mathrm{~s}, 1 \mathrm{H}), 3.77$ $(\mathrm{s}, 3 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 2.92-2.82(\mathrm{~m}, 1 \mathrm{H}), 2.81-2.71(\mathrm{~m}, 2 \mathrm{H}), 2.24-$ $2.08(\mathrm{~m}, 2 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H})$.

Then, in a round-bottomed flask, compound $9(6.0 \mathrm{~g}, 19.09 \mathrm{mmol})$ was dissolved in anhydrous $\mathrm{MeOH}(100 \mathrm{~mL})$ before $\mathrm{CoCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ $(2.72 \mathrm{~g}, 11.45 \mathrm{mmol})$ was added at $0^{\circ} \mathrm{C}$. Subsequently, $\mathrm{NaBH}_{4}(4.35 \mathrm{~g}$, 114.78 mmol ) was added porionwise, and the reaction mixture was warmed to room temperature and stirred for 12 h . After the reactant was consumed, the reaction was quenched by $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL}) . \mathrm{MeOH}$ in the mixture was evaporated, and the residual mixture was extracted with ethyl acetate $(50 \mathrm{~mL} \times 3)$. The organic layers were washed by saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution $(100 \mathrm{~mL} \times 3)$ and brine $(100 \mathrm{~mL} \times 3)$; then, the organic phase was dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated. The residue was purified by flash column chromatography (petroleum ether/ethyl acetate $=2: 1)$ to give product $10(2.18 \mathrm{~g}, 40 \%)$ as a white solid. ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 6.64(\mathrm{~s}, 1 \mathrm{H}), 5.56(\mathrm{~s}, 1 \mathrm{H}), 4.29(\mathrm{~d}, J=9.1$ $\mathrm{Hz}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.37-3.26(\mathrm{~m}, 2 \mathrm{H}), 2.47-2.42(\mathrm{~m}, 2 \mathrm{H}), 2.13-$ $2.08(\mathrm{~m}, 1 \mathrm{H}), 1.84-1.81(\mathrm{~m}, 2 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H})$.

Compound $10(1.0 \mathrm{~g}, 3.5 \mathrm{mmol})$ was dissolved in 10 mL of DCM; then, the HCl ( $9 \mathrm{~mL}, 4 \mathrm{M}$ in dioxane) was added. The reaction mixture was stirred at $20^{\circ} \mathrm{C}$ for 12 h , and the mixture was concentrated in vacuo to get a white solid 11, which could be used for the following step without purification.

Synthesis Procedure of Compound 13. To a solution of Boc-L-PheOH $12(1.1 \mathrm{~g}, 3.5 \mathrm{mmol})$ in DCM $(40 \mathrm{~mL})$ was added HATU $(1.9 \mathrm{~g}$, 4.9 mmol ) sequentially at $-20^{\circ} \mathrm{C}$, and then the residue concentrated crude product $11(0.77 \mathrm{~g} 3.5 \mathrm{mmol})$ was added. After 30 min later, DIPEA ( $1.7 \mathrm{~mL}, 10.5 \mathrm{mmol}$ ) was added dropwise. Then, the reaction mixture was stirred at $-20^{\circ} \mathrm{C}$ for 12 h . The resulting mixture was washed by saturated ammonium chloride solution $(100 \mathrm{~mL} \times 3)$, saturated $\mathrm{NaHCO}_{3}$ solution $(100 \mathrm{~mL} \times 3)$, and brine $(100 \mathrm{~mL} \times 3)$. The organic phase layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The resulting mixture residue was purified by column chromatography ( $\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 40: 1 \mathrm{v} / \mathrm{v}$ ) to afford the pure product $13(1.26 \mathrm{~g}, 83 \%)$ as a light solid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.61$ $(\mathrm{d}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{~m}, 5 \mathrm{H}), 6.82(\mathrm{~s}, 1 \mathrm{H}), 5.26(\mathrm{~s}, 1 \mathrm{H}), 4.50(\mathrm{~d}, J=$ $6.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.36-3.25(\mathrm{~m}, 2 \mathrm{H}), 3.12(\mathrm{~m}, 1 \mathrm{H}), 2.99(\mathrm{dd}, J$ $=13.4,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.34(\mathrm{~s}, 2 \mathrm{H}), 2.19-2.10(\mathrm{~m}, 1 \mathrm{H}), 1.81(\mathrm{~m}, 2 \mathrm{H})$, 1.35 (s, 9H).

General Synthesis Procedure of Compounds $16 a-16 p$. To a dry 100 mL flask in which $13(1.5 \mathrm{~g}, 3.5 \mathrm{mmol})$ was dissolved with dry DCM was added $4 \mathrm{M} \mathrm{HCl}(9 \mathrm{~mL}, 35 \mathrm{mmol})$ slowly at $20^{\circ} \mathrm{C}$, and the resulting mixture was stirred at an ambient temperature for 12 h . The solvent was removed in vacuo, and the crude product 14 was directly used in the next step without further purification. Then, trans-3phenylacrylic acid $15 \mathrm{a}(0.49 \mathrm{~g}, 1.5 \mathrm{mmol})$ was dissolved in a dry 100 mL flask with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, HATU $(0.68 \mathrm{~g}, 1.8 \mathrm{mmol})$ was added sequentially at $-20^{\circ} \mathrm{C}$, and then compound $14(0.55 \mathrm{~g} 1.5 \mathrm{mmol})$ was added. DIPEA $(0.73 \mathrm{~mL}, 4.5 \mathrm{mmol})$ was added dropwise after 30 min . Then, the reaction mixture was stirred at $-20^{\circ} \mathrm{C}$ for 12 h , followed by washing with a saturated ammonium chloride solution $(100 \mathrm{~mL} \times 3)$, saturated $\mathrm{NaHCO}_{3}$ solution $(100 \mathrm{~mL} \times 3)$, and brine $(100 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{CH}_{3} \mathrm{OH}, 30: 1 \mathrm{v} / \mathrm{v}\right)$ to afford the pure product $\mathbf{1 6 a}(0.55 \mathrm{~g}, 80 \%)$ as a light solid. ${ }^{1} \mathrm{H}$ NMR (600 MHz , acetone $\left.-d_{6}\right): \delta 8.45(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.82(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H})$, $7.54-7.47(\mathrm{~m}, 3 \mathrm{H}), 7.37-7.31(\mathrm{~m}, 5 \mathrm{H}), 7.26(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.21-$ $7.16(\mathrm{~m}, 2 \mathrm{H}), 6.75(\mathrm{~d}, J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.01(\mathrm{td}, J=8.4,5.1 \mathrm{~Hz}, 1 \mathrm{H})$, $4.53(\mathrm{~m}, 1 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.33-3.24(\mathrm{~m}, 3 \mathrm{H}), 3.04(\mathrm{dd}, J=13.9,8.5$ $\mathrm{Hz}, 1 \mathrm{H}), 2.46(\mathrm{dd}, J=9.8,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.31(\mathrm{dd}, J=7.4,4.8 \mathrm{~Hz}, 1 \mathrm{H})$, 2.24-2.15 (m, 1H), 1.79 (m, 2H).

General Synthesis Procedure of Compounds 17a-17p. In a dry 100 mL flask was dissolved $16 \mathrm{a}(0.92 \mathrm{~g}, 2.0 \mathrm{mmol})$ in dry THF, $\mathrm{NaBH}_{4}$ $(0.6 \mathrm{~g}, 16 \mathrm{mmol})$ was added slowly at $0{ }^{\circ} \mathrm{C}$, and then, the reaction mixture was stirred at rt for 3 h . The completion of the reaction was confirmed by TLC; then the reaction was quenched and concentrated to get a crude residue. The residue was dissolved in DCM and washed with saturated ammonium chloride solution $(50 \mathrm{~mL} \times 3)$, saturated
$\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL} \times 3)$, and brine $(50 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography ( $\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 20: 1 \mathrm{v} / \mathrm{v}$ ) to afford the pure product $\mathbf{1 7 a}(0.77 \mathrm{~g}, 90 \%)$ as a light solid. ${ }^{1} \mathrm{H}$ NMR (500 MHz , methanol- $d_{4}$ ): $\delta 7.97(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.55-7.48(\mathrm{~m}, 3 \mathrm{H})$, $7.40-7.34(\mathrm{~m}, 3 \mathrm{H}), 7.32-7.28(\mathrm{~m}, 4 \mathrm{H}), 7.23(\mathrm{td}, J=6.0,3.2 \mathrm{~Hz}, 2 \mathrm{H})$, $6.67(\mathrm{~d}, J=15.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.74(\mathrm{dd}, J=8.1,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.98-3.91(\mathrm{~m}$, $1 \mathrm{H}), 3.44(\mathrm{dd}, J=11.0,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.34-3.22(\mathrm{~m}, 4 \mathrm{H}), 3.17(\mathrm{dd}, J=$ $13.7,6.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.05(\mathrm{dd}, J=13.7,8.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.46(\mathrm{dd}, J=9.8,2.5$ $\mathrm{Hz}, 1 \mathrm{H}), 2.37-2.27(\mathrm{~m}, 1 \mathrm{H}), 1.98-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.81-1.69(\mathrm{~m}, 1 \mathrm{H})$, $1.55(\mathrm{~m}, 1 \mathrm{H})$.

General Synthesis Procedure of Compounds 1 and 18b-18p. To a solution of the $17 \mathrm{a}(0.87 \mathrm{~g}, 2.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added DMP $(1.01 \mathrm{~g}, 2.4 \mathrm{mmol})$ slowly, and the reaction mixture was stirred at room temperature for 5 h . The completion of the reaction was confirmed by TLC, the reaction was quenched and concentrated, and the reaction was filtered and washed with saturated $\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL} \times 3)$ and brine $(50 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography ( $\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 20: 1 \mathrm{v} / \mathrm{v}$ ) to afford the pure product $1(0.65 \mathrm{~g}, 76 \%)$ as a light solid. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}\right.$, acetone- $\left.d_{6}\right): \delta 9.38(\mathrm{~s}, 1 \mathrm{H}), 7.57$ (dt, $J=10.6,8.4 \mathrm{~Hz}, 4 \mathrm{H}), 7.42-7.36(\mathrm{~m}, 3 \mathrm{H}), 7.34-7.25(\mathrm{~m}, 4 \mathrm{H}), 7.22$ $(\mathrm{d}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.84(\mathrm{~s}, 1 \mathrm{H}), 6.80-6.72(\mathrm{~m}, 1 \mathrm{H}), 4.90(\mathrm{dd}, J=7.9$, $5.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.54-4.19(\mathrm{~m}, 1 \mathrm{H}), 4.06-3.80(\mathrm{~m}, 1 \mathrm{H}), 3.29-3.16(\mathrm{~m}$, $3 \mathrm{H}), 3.11(\mathrm{~m}, 1 \mathrm{H}), 2.40-2.17(\mathrm{~m}, 2 \mathrm{H}), 1.97(\mathrm{dd}, J=14.1,3.8 \mathrm{~Hz}, 1 \mathrm{H})$, 1.82-1.48 (m, 2H).

General Synthesis Procedure of Compounds $19 a$ and 19b. To a solution of the $1(0.86 \mathrm{~g}, 2.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were added methyl(triphenylphosphoranylidene) acetate ( $0.80 \mathrm{~g}, 2.4 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}$ $(0.56 \mathrm{~mL}, 4 \mathrm{mmol})$; then the reaction mixture was stirred at room temperature for 12 h . The completion of the reaction was confirmed by TLC; then the reaction was washed with saturated ammonium chloride solution $(50 \mathrm{~mL} \times 3)$, saturated $\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL} \times 3)$, and brine $(50 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography $\left(\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 40: 1 \mathrm{v} / \mathrm{v}\right)$ to afford the pure product $19 \mathrm{a}(0.78 \mathrm{~g}$, $78 \%$ ) as a light solid.

Synthesis Procedure of Compound 21. To a solution of Boc-l-ValOH $20(0.76 \mathrm{~g}, 3.5 \mathrm{mmol})$ in DCM $(40 \mathrm{~mL})$ was added HATU $(1.9 \mathrm{~g}$, 4.9 mmol ) sequentially at $-20^{\circ} \mathrm{C}$, and then the residue concentrated crude product $14(1.28 \mathrm{~g} 3.5 \mathrm{mmol})$ was added. After 30 min later, DIPEA ( $1.7 \mathrm{~mL}, 10.5 \mathrm{mmol}$ ) was added dropwise. Then, the reaction mixture was stirred at $-20{ }^{\circ} \mathrm{C}$ for 12 h . The resulting mixture was washed by saturated ammonium chloride solution $(100 \mathrm{~mL} \times 3)$, saturated $\mathrm{NaHCO}_{3}$ solution $(100 \mathrm{~mL} \times 3)$, and brine $(100 \mathrm{~mL} \times 3)$. The organic phase layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The resulting mixture residue was purified by column chromatography ( $\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 40: 1 \mathrm{v} / \mathrm{v}$ ) to afford the pure product $21(1.58 \mathrm{~g}, 85 \%)$ as a light solid. ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.67$ (d, $J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.49(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.24-7.14(\mathrm{~m}, 6 \mathrm{H}), 7.01$ $(\mathrm{s}, 1 \mathrm{H}), 5.11(\mathrm{~d}, J=9.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.97-4.91(\mathrm{~m}, 1 \mathrm{H}), 4.52(\mathrm{t}, J=8.1 \mathrm{~Hz}$, $1 \mathrm{H}), 3.84(\mathrm{t}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.66(\mathrm{~s}, 3 \mathrm{H}), 3.31(\mathrm{~m}, 2 \mathrm{H}), 3.07(\mathrm{~d}, J=5.9$ $\mathrm{Hz}, 2 \mathrm{H}), 2.39-2.27(\mathrm{~m}, 1 \mathrm{H}), 2.18-2.06(\mathrm{~m}, 2 \mathrm{H}), 1.99(\mathrm{dd}, J=13.6$, $6.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.80-1.71(\mathrm{~m}, 2 \mathrm{H}), 1.43(\mathrm{~s}, 9 \mathrm{H}), 0.87(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H})$, 0.82 ( $\mathrm{d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}$ ).

General Synthesis Procedure of Compounds 24a-24e. To a dry 100 mL flask in which $21(1.86 \mathrm{~g}, 3.5 \mathrm{mmol})$ was dissolved in dry DCM was added $4 \mathrm{M} \mathrm{HCl}(9 \mathrm{~mL}, 35 \mathrm{mmol})$ slowly at $20^{\circ} \mathrm{C}$, and the resulting mixture was stirred at an ambient temperature for 12 h . The solvent was removed in vacuo, and the crude product 22 was directly used in next step without further purification. Then compound $\mathbf{2 2}$ was coupled with quinaldic acid 23 d to get the esters $\mathbf{2 4 d}(0.96 \mathrm{~g}, 80 \%)$, and the synthesis procedure is similar to $17 \mathrm{a} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.60(\mathrm{~d}, J=$ $9.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.31(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.25(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.11(\mathrm{~d}, J$ $=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.97-7.86(\mathrm{~m}, 2 \mathrm{H}), 7.81-7.75(\mathrm{~m}, 1 \mathrm{H}), 7.72(\mathrm{~d}, J=8.4$ $\mathrm{Hz}, 1 \mathrm{H}), 7.67-7.59(\mathrm{~m}, 1 \mathrm{H}), 7.27(\mathrm{~s}, 1 \mathrm{H}), 7.16(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H})$, $7.02(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.81(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.00(\mathrm{td}, J=8.3,5.1 \mathrm{~Hz}$, $1 \mathrm{H}), 4.64(\mathrm{ddd}, J=11.6,8.4,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.39(\mathrm{dd}, J=9.2,8.2 \mathrm{~Hz}, 1 \mathrm{H})$, $3.69(\mathrm{~s}, 3 \mathrm{H}), 3.40(\mathrm{t}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.18(\mathrm{dd}, J=13.8,5.0 \mathrm{~Hz}, 1 \mathrm{H})$,
$3.01(\mathrm{dd}, J=13.8,8.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.49-2.40(\mathrm{~m}, 1 \mathrm{H}), 2.23(\mathrm{~m}, 3 \mathrm{H})$, $1.92-1.77(\mathrm{~m}, 2 \mathrm{H}), 1.00(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.95(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H})$.

General Synthesis Procedure of Compounds 25a-25e. In a dry 100 mL flask was dissolved the $\mathbf{2 4 d}(0.88 \mathrm{~g}, 1.5 \mathrm{mmol})$ in dry THF, $\mathrm{NaBH}_{4}(0.45 \mathrm{~g}, 12 \mathrm{mmol})$ was added slowly at $0{ }^{\circ} \mathrm{C}$, and then the reaction mixture was stirred at rt for 3 h . The completion of the reaction was confirmed by TLC; then the reaction was quenched and concentrated to get a crude residue. The residue was dissolved in DCM and washed with saturated ammonium chloride solution ( 50 mL $\times 3)$, saturated $\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL} \times 3)$, and brine $(50 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography $\left(\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 20: 1\right.$ $\mathrm{v} / \mathrm{v})$ to afford the pure product $25 \mathrm{~d}(0.71 \mathrm{~g}, 85 \%)$ as a light solid. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.60(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.18(\mathrm{~d}, J=8.5$ $\mathrm{Hz}, 1 \mathrm{H}), 8.09(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.93(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.84(\mathrm{~d}, J=$ $7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.65(\mathrm{t}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.62-7.52(\mathrm{~m}, 2 \mathrm{H}), 7.19(\mathrm{~d}, J=$ $7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.09(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.02-6.87(\mathrm{~m}, 2 \mathrm{H}), 4.91(\mathrm{dd}, J=$ $14.4,8.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.45(\mathrm{dd}, J=8.0,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.10-3.98(\mathrm{~m}, 1 \mathrm{H})$, 3.57 (ddd, $J=33.4,11.4,4.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.43-3.23(\mathrm{~m}, 3 \mathrm{H}), 3.17(\mathrm{dd}, J=$ $13.7,5.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{dd}, J=13.7,8.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.35(\mathrm{~m}, 3 \mathrm{H}), 2.16-$ $2.00(\mathrm{~m}, 1 \mathrm{H}), 1.78(\mathrm{dd}, J=11.5,9.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.57(\mathrm{~m}, 1 \mathrm{H}), 0.97(\mathrm{~d}, J=$ $6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.92(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H})$.

General Synthesis Procedure of Compounds 26a-26e. To a solution of the $25 \mathrm{~d}(0.56 \mathrm{~g}, 1.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added DMP ( $0.51 \mathrm{~g}, 1.2 \mathrm{mmol}$ ) slowly, and the reaction mixture was stirred at room temperature. The completion of the reaction was confirmed by TLC; then, the reaction was quenched and concentrated, and the reaction was filtered and washed with saturated $\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL} \times 3)$ and brine $(50 \mathrm{~mL} \times 3)$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated, and the residue was purified by column chromatography $\left(\mathrm{DCM} / \mathrm{CH}_{3} \mathrm{OH}, 20: 1 \mathrm{v} / \mathrm{v}\right)$ to afford the pure product $26 \mathrm{~d}(0.42 \mathrm{~g}$, $76 \%$ ) as a light solid.

Materials and Methods. Protein Expression and Purification. The full-length gene encoding the EV71 3C ${ }^{\text {pro }}$ and the SARS-CoV-2 $3 \mathrm{CL}^{\text {pro }}$ with an N -terminal $6 \times \mathrm{His}$-SUMO2 fusion tag was cloned into the pET-15b vector. The resulting plasmids were transformed into BL21 (DE3) cells for protein expression. The expressed proteins were purified by a Ni-NTA column (GE) and transformed into the cleavage buffer ( 25 mM Tris, $\mathrm{pH} 7.5,300 \mathrm{mM} \mathrm{NaCl}, 2 \mathrm{mM} \mathrm{DTT}$ ) containing SUMO Specific Peptidase 2 (SENP2) for removing the $6 \times$ HisSUMO2 fusion tag. The resulting protein samples were further purified by Q-Sepharose (GE Healthcare) and Superdex200 (GE Healthcare). The eluted EV71 $3 C^{\text {pro }}$ and SARS-CoV-2 $3 C^{\text {pro }}$ were stored in a solution containing 25 mM Tris ( pH 8.0 ), 500 mM NaCl , and 2 mM DTT, and in a solution containing 10 mM Tris ( pH 7.5 ), respectively.

Protein Crystallization and Structure Determination. The purified EV71 $3 C^{\text {pro }}$ was concentrated to $10 \mathrm{mg} / \mathrm{mL}$ and incubated 1 h with 2 mM 18 p before crystallization condition screening. Crystallization was performed at $20^{\circ} \mathrm{C}$ using a hanging drop vapor-diffusion method, by mixing equal volumes $(1: 1 \mu \mathrm{~L})$ of the protein and crystallization solution. Crystals were finally yielded in a solution containing 0.1 M MES monohydrate ( pH 6.0 ), 20\% 2-propanol, and $20 \%$ polyethylene glycol monomethyl ether 2000. Then, crystals were flash-frozen in liquid nitrogen in the presence of the reservoir solution supplemented with $20 \%$ glycerol. X-ray diffraction data were collected at beamline BL18U1 at the Shanghai Synchrotron Radiation Facility. ${ }^{13}$ The data were processed with HKL3000 software packages. ${ }^{14}$ The complex structure was solved by molecular replacement using the program PHASER ${ }^{15}$ with a search model of PDB code 4GHT. The model was built using Coot ${ }^{16}$ and refined with a simulated-annealing protocol implemented in the program PHENIX. ${ }^{17}$ The refined structure was deposited to the Protein Data Bank with an accession code, 7DNC.

Inhibition Assays of the EV71 3C pro and the SARS-CoV-2 3CL pro. A fluorescence resonance energy transfer (FRET) protease assay was applied to measure the inhibitory activity of compounds against the EV71 3C ${ }^{\text {pro }}$. The fluorogenic substrate Dacyl-KTSAVLQSGFRKMEEdans was synthesized by GenScript (Nanjing, China). The assay was performed in a total volume of $120 \mu \mathrm{~L}$. The recombinant EV71 3C ${ }^{\text {pro }}$ at a final concentration of $5 \mu \mathrm{M}$ was mixed with serial dilutions of each compound in $80 \mu \mathrm{~L}$ of assay buffer ( 25 mM Tris, $\mathrm{pH} 8.0,150 \mathrm{mM}$

NaCl , and $10 \%$ glycerol) and incubated for 10 min . The reaction was initiated by adding $40 \mu \mathrm{~L}$ of a fluorogenic substrate at a final concentration of $25 \mu \mathrm{M}$. The reaction solution was then incubated at 30 ${ }^{\circ} \mathrm{C}$ for 3 h . After that, the fluorescence signal at 340 nm (excitation)/ 490 nm (emission) was measured immediately with a Bio-Tek Synergy4 plate reader.

The inhibition assay of the SARS-CoV-2 $3 \mathrm{CL}^{\text {pro }}$ has been described previously. ${ }^{18}$ In brief, the recombinant SARS-CoV-2 3CL ${ }^{\text {pro }}$ at a concentration of 30 nM was mixed with serial dilutions of each compound in $80 \mu \mathrm{~L}$ of assay buffer ( 50 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.3,1 \mathrm{mM}$ EDTA) and incubated for 10 min . The reaction was initiated by adding $40 \mu \mathrm{~L}$ of a fluorogenic substrate (MCA-AVLQSGFR-Lys(Dnp)-LysNH 2 ) at a final concentration of $20 \mu \mathrm{M}$. After that, the fluorescence signal at 320 nm (excitation) $/ 405 \mathrm{~nm}$ (emission) was measured immediately every 35 s for 3.5 min with a Bio-Tek Synergy4 plate reader. The velocities of reactions with compounds added at various concentrations compared to the reaction added with DMSO were calculated and used to generate inhibition profiles. For each compound, at least three independent experiments were performed for the determination of $\mathrm{IC}_{50}$ values. The $\mathrm{IC}_{50}$ values were expressed as the mean $\pm$ SD and determined via nonlinear regression analysis using GraphPad Prism software 8.0 (GraphPad Software, Inc., San Diego, CA, USA).

Cells. RD cells were maintained in MEM Rega-3 medium supplemented with $2 \%$ FBS, 2 mM L-glutamine, and $0.075 \%$ $\mathrm{NaHCO}_{3}$, all supplied by Gibco, Life Technologies. Cells were maintained at $37^{\circ} \mathrm{C}$ in a humidified atmosphere of $5 \% \mathrm{CO}_{2}$.

The Vero E6 cell line was obtained from American Type Culture Collection (ATCC, no. 1586) and maintained in Dulbecco's modified Eagle medium (DMEM; Gibco Invitrogen) supplemented with $10 \%$ fetal bovine serum (FBS; Gibco Invitrogen), $1 \%$ antibiotic/antimycotic (Gibco Invitrogen), at $37^{\circ} \mathrm{C}$ in a humidified $5 \% \mathrm{CO}_{2}$ incubator.

Viruses. Enterovirus 71 strain $\mathrm{BrCr}(\mathrm{EV} 71 \mathrm{BrCr})$, kindly provided by Prof. Dr. F. van Kuppeveld (Universiteit Utrecht, The Netherlands), was grown on RD cells. When a full cytopathic effect (CPE) was observed, the virus was harvested from the supernatants after centrifugation ( $10 \mathrm{~min}, 3000 \mathrm{rpm}$ ) and stored at $-80^{\circ} \mathrm{C}$. The viral titer was determined by end point titration.

A clinical isolate of SARS-CoV-2 (nCoV-2019BetaCoV/Wuhan/ WIV04/2019) was propagated in Vero E6 cells, and a viral titer was determined by TCID50. ${ }^{8 \mathrm{a}}$ All infection experiments were performed at biosafety level-3 (BSL-3).

Antiviral Assay. The anti-EV71 activity of selected compounds was tested in RD cells and seeded in a 96 -well plate $(2.5 \times 104$ cells/well $)$. Cells were allowed to adhere overnight, after which cells were infected with EV71; a serial dilution of selected compounds was added and incubated for 4 days, i.e., until complete CPE was observed in the untreated and infected virus control conditions. CPE was subsequently quantified using an MTS-reduction assay (MTS $=3 \mathrm{f}$-(4,5-dimethylth-iazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium, inner salt). For this, a MTS/phenazine methosulfate (PMS) stock solution ( $2 \mathrm{mg} / \mathrm{mL}$ MTS (Promega, Leiden, The Netherlands) and $46 \mu \mathrm{~g} / \mathrm{mL}$ PMS (Sigma-Aldrich, Bornem, Belgium) in PBS at pH 6-6.5) was diluted 1:20 in MEM (Life Technologies, Gent, Belgium cat. no. 21090-022). The medium was aspirated from wells, and $75 \mu \mathrm{~L}$ of MTS/PMS solution was added. After $1-2 \mathrm{~h}$ of incubation at $37^{\circ} \mathrm{C}$, the absorbance was measured at 498 nm . The \% inhibition for each well is then calculated by normalization of the absorbance to the condition of untreated-infected cells ( $=0 \%$ inhibition) and the condition of untreated-uninfected cells ( $=100 \%$ inhibition). From the obtained dose-response curve, the $\mathrm{EC}_{50}$ is calculated by curve fitting using Dotmatics software.

To assess the antiviral activity of compounds against SARS-CoV-2, preseeded Vero E6 cells ( $5 \times 10^{4}$ cells/well) were treated with different concentrations of the indicated compounds for 1 h and then were infected with SARS-CoV-2 at an MOI of 0.01 . At 24 h pi, the cell supernatant was collected, and a viral RNA copy number in the cell supernatant was measured using real-time PCR, as described previously. ${ }^{19}$

The antiviral activity of selected compounds against EV68, CoxA21, CoxB3, RV-A02, and RV-B14 was tested as described previously. ${ }^{20}$

To assess the cytotoxicity of the test compounds, Vero E6 cells preseeded in a 96 -well dish $\left(2 \times 10^{4}\right.$ cells/well) were treated with different concentrations of the indicated compounds, and 24 h later, the relative numbers of surviving cells were measured with cell counting kit8 (GK10001, GLPBIO) according to the manufacturer's instructions.

Pharmacokinetic Profiles in CD-1 Mice. Male CD-1 mice ( $n=3$ per group) were treated with a solution of compounds 18 p and 26d (DMSO/EtOH/PEG300/NaCl (5:5:40:50, v/v/v/v)) at doses of 20 $\mathrm{mg} / \mathrm{kg}, 5 \mathrm{mg} / \mathrm{kg}$, and $5 \mathrm{mg} / \mathrm{kg}$ via intraperitoneal (ip), subcutaneous (sc), and intravenous (iv), respectively. Blood samples were collected at $0.05,0.25,0.75,2,4,8$, and 24 h after administration. Serum samples were obtained through common procedures, and the concentrations of the compound in the supernatant were analyzed by LC-MS/MS.

All procedures relating to animal handling, care, and treatment were performed according to the guidelines approved by the Institutional Animal Care and Use Committee of the contract research organizations performing the study.
