Received 10 December 2011; accepted 13 December 2011

Key indicators: single-crystal X-ray study; $T = 290\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.028; wR factor = 0.067; data-to-parameter ratio = 16.6.

In the title compound, $\text{C}_{14}\text{H}_{10}\text{Cl}_2\text{INO}_3\text{S}$, the dihedral angle between the benzene rings is $52.13(10)^\circ$. In the crystal, the components are linked by pairs of $\text{N}-\text{H}\cdots\text{O}(\text{sulfonyl})$ hydrogen bonds into centrosymmetric dimers.

2-Chloro-N-(4-chloro-3-iodophenyl)-4-(methylsulfonyl)benzamide

D.-C. Wang, H. Song, C. Yang, W.-C. Huang and S. Yao

Comment

The benzamide moiety is the constituent of many biologically significant compounds including anticancer compounds (Castanedo *et al.*, 2010; Tremblay *et al.*, 2010; Mahindroo *et al.*, 2010). The title compound is one of the key intermediates in our synthetic investigations of anticancer drugs. In this paper, we synthesized the title compound and report its crystal structure, Fig. 1. The dihedral angle between the two benzene rings is 52.13 (10) $^{\circ}$. In the crystal, the molecules are connected *via* intermolecular N—H \cdots O hydrogen bonds to form a centrosymmetric dimer, in which the amide H atom acts as a donor and the sulfonyl-O atom act as an acceptor, Table 1.

Experimental

The title compound was prepared by a method similar to that of Robarge *et al.* (2009). Crystals were obtained by slow evaporation from its methanol-acetic acid (5:2) solution.

Refinement

All H atoms were positioned geometrically (C—H = 0.93–0.96 Å; N—H = 0.86 Å) and allowed to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{parent})$.

Figures

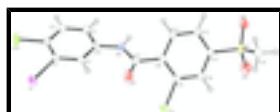

Fig. 1. The molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.028$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.067$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0257P)^2 + 0.4057P]$ where $P = (F_o^2 + 2F_c^2)/3$
3323 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
200 parameters	$\Delta\rho_{\text{max}} = 0.43 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.55 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
