

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-
19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

# Corrigendum to "At the height of the storm: Healthcare staff's health conditions and job satisfaction and their associated predictors during the epidemic peak of COVID-19" [Brain Behav. Immun. 87 (2020) 144-146]

The authors regret errors in the abstract, the sixth paragraph of the article and the capital of Table 1, which were inadvertently introduced during the process of production. These corrections had not altered the results, interpretation or conclusions of the paper. The authors would like to apologise for any inconvenience caused. The correct abstract, sixth paragraph and Table 1 appear below and references cited are as in the original manuscript.

Abstract
This study reports the physical health, mental health, anxiety, depression, distress, and job satisfaction of healthcare staff in Iran when the country faced its highest number of total active COVID-19 cases. In a sample of 304 healthcare staff (doctors, nurses, radiologists, technicians, etc.), we found a sizable portion reached the cutoff levels of disorders in anxiety ( $30.6 \%$ ), depression ( $28.0 \%$ ), and distress ( $20.1 \%$ ). Age, gender, education, access to PPE (personal protective equipment), healthcare institutions (public vs. private), and individual status of COVID-19 infection each predicted some but not all the outcome variables of SF12, PHQ-4, K6, and job satisfaction. The healthcare workers varied
greatly in their access to PPE and in their status of COVID-19 infection: negative ( $69.7 \%$ ), unsure ( $28.0 \%$ ), and positive ( $2.3 \%$ ). The predictors were also different from those identified in previous studies of healthcare staff during the COVID-19 crisis in China. This study helps to identify the healthcare staff in need to enable more targeted help as healthcare staff in many countries are facing peaks in their COVID-19 cases.

The mental health composite of SF-12 was 26.3 (7.5), significantly lower ( $\mathrm{p}<0.001$ ) than those reported in three previous studies of 46.3 (10.4), 44.2 (10.8), and 44.6 (11.9) respectively (Montazeri et al., 2009; Rohani et al., 2010; Montazeri et al., 2011). The physical health composite of SF-12 was 40.7 (7.0), also significantly lower ( $\mathrm{p}<0.001$; $\mathrm{p}<$ $0.001 ; \mathrm{p}<0.05$ ) than reported in the above studies of 50.1 (8.5), 48.2 (8.2), and 42.3 (11.4). A sizable percentage of healthcare staff reached the cutoff values for mental disorder concerns on distress ( $20.1 \%$ by K6), depression ( $28.0 \%$ by PHQ-4), and anxiety ( $30.6 \%$ by PHQ-4).

[^0]Table 1
Descriptive statistics and risk factors of the health conditions (SF-12, PHQ-4 and K6) and job satisfaction among healthcare staff (*p $<0.05$ ).
