Received 28 October 2011; accepted 9 November 2011

Key indicators: single-crystal X-ray study; $T = 153\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.032; wR factor = 0.068; data-to-parameter ratio = 17.9.

In the title compound, $\text{C}_9\text{H}_7\text{NO}_3\text{S}$, the benzothiazolone ring system is essentially planar, with a maximum deviation of $0.013(2)\text{ \AA}$. In the crystal, molecules are linked via $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, forming chains along [010]. In addition, weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds are present.

2-(3-Oxo-2,3-dihydro-1,2-benzothiazol-2-yl)acetic acid

X. Wang, J.-X. Yang, C. You, X. Tan and Q. Lin

Comment

2-(3-Oxobenzo[*d*]isothiazol-2(3*H*)-yl)acetic acid is an important intermediate in the synthesis of benzisothiazolone derivatives (Davis, 1972; Maggiali, *et al.*, 1982, 1983; Elgazwy & Abdel-Sattar, 2003). The corresponding esters and amides have been reported to possess high antibacterial and antifungal activity (Mor *et al.*, 1996; Taubert *et al.*, 2002). In view of the importance of 1,2-benzisothiazol-3(2*H*)-ones, the title compound, (I), was synthesized and its crystal structure is presented herein.

The molecular structure of the title compound (I) is shown in Fig. 1. Examples of related structures appear in the literature (Xu, *et al.*, 2006; Wang, *et al.*, 2011*a,b,c*). In (I) the benzoisothiazolone ring system is essentially planar, with a maximum deviation of 0.013 (2) Å. In the crystal, molecules are linked *via* O—H···O hydrogen bonds to form one-dimensional chains along [010]. In addition weak intermolecular C—H···O hydrogen bonds are present.

Experimental

Chloroacetic acid (0.95 g, 0.01 mol) was added dropwise to a solution of sodium hydroxide (0.80 g, 0.02 mol) and benzo[*d*]isothiazol-3(2*H*)-one (1.50 g, 0.01 mol) in water (20 ml) under stirring on an ice-water bath. The reaction mixture was stirred at room temperature for 4.5 h and adjusted pH to 1~2, to afford the title compound (1.05 g, yield 50.0%). Single crystals suitable for X-ray measurements were obtained by recrystallization of the title compound from the mixed solution of dimethyl formamide and water at room temperature.

Refinement

Atom H3O was located from the difference Fourier map and was refined freely [O—H = 0.86 (3) Å]. The remaining H atoms bonded to C atoms were fixed geometrically and allowed to ride on their attached atoms, with the carrier atom-H distances = 0.95 Å for aryl, 0.99 for methylene, and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

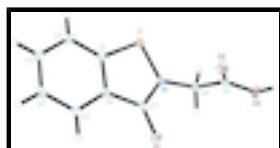

Fig. 1. The molecular structure of the title compound with displacement ellipsoids drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius.

	Absolute structure: Flack (1983), 945 Friedel pairs

Primary atom site location: structure-invariant direct Flack parameter: 0.08 (7)
methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
