Crystal structure of bis(propane-1,3-diaminium) hexafluoridoaluminate diaquatetrafluorido-aluminate tetrahydrate

Insaf Abdi,[a] Khulood Al-Sadhan[b] and Amor Ben Ali[a]*

[a]Université de Carthage, Faculté des Sciences de Bizerte, UR11ES30, 7021 Jarzouna, Tunisia, and [b]Department of Chemistry, Girls College of Science, University of Dammam, PO Box 838, Dammam 31113, Saudi Arabia. *Correspondence e-mail: amor.benali@fsb.rnu.tn

The title compound, $(C_3H_{12}N_2)_2[AlF_6][AlF_4(H_2O)_2]\cdot4H_2O$, was obtained by a solvothermal method in ethanol as solvent and with aluminium hydroxide, HF and 1,3-diaminopropane as educts. The asymmetric unit contains a quarter each of two crystallographically independent propane-1,3-diammonium dications, $[AlF_6]^{3-}$ and $[AlF_4(H_2O)_2]^-$ anions and four water molecules. The cations, anions and three of the independent water molecules are situated on special positions mm, while the fourth water molecule is disordered about a mirror plane. In the crystal, intermolecular N—H···F and O—H···F hydrogen bonds link the cations and anions into a three-dimensional framework with the voids filled by water molecules, which generate O—H···O hydrogen bonds and further consolidate the packing.

1. Chemical context

Hybrid organic–inorganic fluoride compounds are composed of both organic and inorganic moieties. The search for new compounds in this class of materials is still intense due to their applications in many domains such as gas storage, catalysis, separation, ion-exchange and biomedicine (Horcajada et al., 2012; Stock & Biswas, 2012). Various hybrid materials containing fluorine organic ligands have been described in the literature (Ben Ali et al., 2007). The dimensionality of the metal fluoride entities are 0D (isolated polyanions) (Adil, Ben Ali et al., 2006; Adil, Leblanc & Maisonneuve, 2006; Fourquet et al., 1987) , 1D (chains) or 2D (layers) (Adil et al., 2010). The structural architecture of hybrid materials mainly depends on the metal and an organic part. However, other physical and physicochemical factors affect the resulting products such as the synthesis method (temperature, concentration, time of heating etc.) (Su et al., 2010). This work is a continuation of an exploration of chemical systems including metal fluoride and amine, and the study of their structures.

$$2\left(H_3N^+ \diagup\diagdown NH_3^+\right) \quad AlF_6^{3-} \quad AlF_4(H_2O)_2^- \quad 4H_2O$$
2. Structural commentary

The asymmetric unit of the title compound contains aluminum atoms located in two crystallographically independent sites with different environments, $[Al2F_6]$ and $[Al1F_4(H_2O)_2]$, and two independent 1,3-propane diamine (dap) dications (Fig. 1). The Al—F distances in the two octahedra range from 1.768 (2)
Figure 1
A portion of the crystal structure of the title compound showing the atom labelling and 50% probability displacement ellipsoids. Dashed lines denote hydrogen bonds. [Symmetry codes: (i) $\frac{1}{2} - x$, $\frac{1}{2} - y$, $-1 - z$; (ii) $1 - x$, y, z; (iii) x, y, $-z$; (v) $\frac{1}{2} - x$, $\frac{1}{2} - y$, $1 + z$; (vi) $-x$, y, z; (vii) x, $-y$, $-1 - z$; (viii) x, y, $1 + z$.]

to 1.809 (3) Å while the Al1—OW1 distance is longer [1.944 (4) Å]. The [AlF$_6$] octahedron is regular whereas [AlF$_4$(H$_2$O)$_2$] exhibits a pronounced distortion due to the strong influence of the crystal field created by the hetero-ligands (F$^-$/H$_2$O). The value of the calculated valences (3.08 for Al1 and 3.01 for Al2) of the individual Al^{3+} cations (Brese & O'Keeffe, 1991) is in good agreement with the theoretical value, whereas those for the F$^-$ anions are equal to 0.5. These anions complete their valence by establishing strong hydrogen bonds.

3. Supramolecular features

Each [AlF$_4$(H$_2$O)$_2$] octahedron is linked *via* N—H···F or O—H···F hydrogen bonds (Table 1) to one type of the organic cations (Fig. 2), with the formation of infinite chains parallel to the *a* axis. These chains are linked to each other by the AlF$_6{}^{3-}$ dications and form infinite (H$_2$dap)[AlF$_4$(H$_2$O)$_2$] layers parallel to the *ac* plane (Fig. 3) . These layers are connected by the second organic cations and form a three-dimensional framework showing cavities, which are filled with the lattice water molecules.

Figure 2
The environment of the AlF$_4$(H$_2$O)$_2$ octahedron. Dashed lines denote hydrogen bonds.

Table 1
Hydrogen-bond geometry (Å, °).

D—H···A	D—H	H···A	D···A	D—H···A
N1—H1A···F2	0.89	1.79	2.679 (6)	177
N1—H1B···F5^i	0.89	1.99	2.846 (5)	161
N1—H1C···F5^{ii}	0.89	1.99	2.846 (5)	161

Symmetry codes: (i) $-x + \frac{1}{2}$, $-y + \frac{1}{2}$, $z + 1$; (ii) $-x + \frac{1}{2}$, $-y + \frac{1}{2}$, $-z - 1$; (iii) $-x + \frac{1}{2}$, $-y + \frac{1}{2}$, $z - 1$; (iv) x, y, $z + 1$; (v) x, y, $-z$.

4. Database survey

In the Cambridge Structural Database (Version 5.35; Groom & Allen, 2014) numerous *Class I* fluoridoaluminates with isolated (poly)anions or extended 1D inorganic chains, 2D inorganic layers or 3D networks are mentioned. Eight compounds with AlF$_6{}^{3-}$ anions exist (Grottel *et al.*, 1992; Rother *et al.*, 1996, 1998; Touret *et al.*, 2001; Adil *et al.*, 2009; Bentrup *et al.*, 1996) and seven compounds containing the AlF$_5$(H$_2$O)$^{2-}$ anion (Cadiau *et al.*, 2008; Petrosyants *et al.*, 1997; Schröder *et al.*, 1993). However, to our knowledge, no fluoridoaluminate hybrid compounds containing both the AlF$_6{}^{3-}$ and AlF$_5$(H$_2$O)$^{2-}$ anions have been reported.
Figure 3
The crystal packing of the title compound, viewed approximately along [001].

5. Synthesis and crystallization

The title compound was prepared from a starting mixture of AlF_3 (0.5 g) in 40% HF (1.5 ml) and ethanol (5 ml). 1,3-Di-aminopropane (0.54 ml) was added and mild hydrothermal conditions (463 K) were applied in a Teflon-lined autoclave (25 ml). The resulting product was washed with ethanol and dried in air giving colourless single crystals.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The H atoms of the NH_3 and CH_2 groups of the organic molecule were fixed geometrically [N—H = 0.89 (1) and C—H = 0.97 (1) Å with $U_{iso}(H)$ = $1.2U_{eq}(N,C)$]. All H atoms of the water molecules were located from a Fourier difference map. The O—H distances and H—O—H angles were fixed [O—H = 0.84 (1) and H$\cdots$H = 1.34 (1) Å with $U_{iso}(H)$ =$1.5U_{eq}(O)$]. The water molecule OW5

is disordered over two positions with the occupanies fixed to 0.5.

Crystal structure of bis(propane-1,3-diaminium) hexafluoridoaluminate diaqua-tetrafluoridoaluminate tetrahydrate

Insaf Abdi, Khulood Al-Sadhan and Amor Ben Ali

Computing details

Data collection: *STADI4* (Stoe & Cie, 2002); cell refinement: *STADI4* (Stoe & Cie, 2002); data reduction: *X-RED* (Stoe & Cie, 2002); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXS97* (Sheldrick, 2008) within *WinGX* (Farrugia, 2012); molecular graphics: *DIAMOND* (Brandenburg, 2006); software used to prepare material for publication: *publCIF* (Westrip, 2010).

Bis(propane-1,3-diaminium) hexafluoridoaluminate diaquatetrafluoridoaluminate tetrahydrate

Crystal data

$(C_3H_{12}N_2)_2[AlF_6][AlF_4(H_2O)_2]\cdot 4H_2O$	$F(000) = 1056$
$M_r = 504.35$	$D_x = 1.593$ Mg m^{-3}
Orthorhombic, *Cmmm*	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -C 2 2	Cell parameters from 32 reflections
$a = 12.975$ (5) Å	$\theta = 2$–27.5°
$b = 25.115$ (9) Å	$\mu = 0.26$ mm^{-1}
$c = 6.452$ (9) Å	$T = 293$ K
$V = 2103$ (3) Å^3	Platelets, colourless
$Z = 4$	$0.24 \times 0.12 \times 0.05$ mm

Data collection

Siemens AED2 diffractometer	$R_{int} = 0.000$
	$\theta_{max} = 27.5°$, $\theta_{min} = 1.6°$
Radiation source: fine-focus sealed tube	$h = 0 \rightarrow 16$
Graphite monochromator	$k = 0 \rightarrow 32$
$2\theta/\omega$ scan	$l = 0 \rightarrow 8$
1371 measured reflections	3 standard reflections every 120 min
1371 independent reflections	intensity decay: 4%
939 reflections with $I > 2\sigma(I)$	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.148$	
$S = 1.12$	H atoms treated by a mixture of independent and constrained refinement
1371 reflections	
105 parameters	$w = 1/[\sigma^2(F_o^2) + (0.0452P)^2 + 2.9098P]$
10 restraints	where $P = (F_o^2 + 2F_c^2)/3$
Primary atom site location: structure-invariant direct methods	$(\Delta/\sigma)_{max} < 0.001$
	$\Delta\rho_{max} = 0.46$ e Å^{-3}

$\Delta\rho_{min} = -0.48$ e Å^{-3}

Extinction correction: *WinGX* (Farrugia, 2012),
$Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.0022 (7)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
