

N-Benzylpyridin-2-amine**Gai Gai Wang and Hong Zhao***

School of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China
Correspondence e-mail: zhaozhong@seu.edu.cn

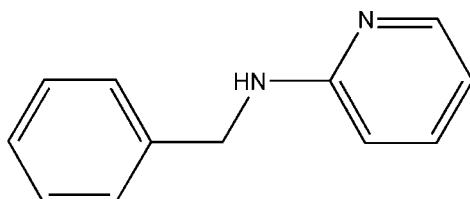

Received 26 October 2010; accepted 29 October 2010

Key indicators: single-crystal X-ray study; $T = 295\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$;
 R factor = 0.076; wR factor = 0.183; data-to-parameter ratio = 15.4.

In the title compound, $\text{C}_{12}\text{H}_{12}\text{N}_2$, the dihedral angle between the benzene and pyridine rings is $67.63(8)^\circ$. Molecules are linked into centrosymmetric dimers by a simple intermolecular $\text{N}-\text{H}\cdots\text{N}$ hydrogen bond with graph-set motif $R_2^2(8)$.

N-Benzylpyridin-2-amine

G. G. Wang and H. Zhao

Comment

Schiff base compounds have attracted great attention due to their application in coordination chemistry (Garnovskii *et al.*, 1993; Gong & Xu, 2008), and also offer a simple method of synthesis novel amine compounds. The title compound is synthesized from the Schiff base (*E*)-*N*-benzylideneypyridin-2-amine, and the crystal structure is reported here.

In the molecule of the title compound (Fig. 1) bond lengths and angles have normal values. The dihedral angle between the benzene ring and pyridine ring is $67.63(8)^\circ$. In the solid state the molecules are linked into centrosymmetric dimers by a simple N—H···N interaction with set graph-motif $R_2^2(8)$ (Bernstein *et al.*, 1995), (Fig. 2; Table 1).

Experimental

The (*E*)-*N*-benzylideneypyridin-2-amine was prepared from benzaldehyde and pyridin-2-amine according to the reported method (Xu *et al.*, 2009). To a mixture of (*E*)-*N*-benzylideneypyridin-2-amine (20 mmol), NaBH₄ (100 mmol) in 1,4-dioxane (50 ml), acetic acid (100 mmol) in 1,4-dioxane was added dropwise at 0°C. Then the mixture was heated at 120°C for 2 h then cooled and the solvent removed under vacuum. The residue was poured into water (20 ml) and extracted with chloroform three times (50 ml). The extract was dried (CaCl₂) and the solvent removed under vacuum to give the crude title compound. Pale yellow crystals suitable for X-ray analysis were obtained by slow evaporation of a 95% ethanol/water solution.

Refinement

All H atoms were detected in a difference map, but were placed in calculated positions and refined using a riding motion approximation, with C—H = 0.93–0.97 Å, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$; N—H = 0.86 Å, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

Figures

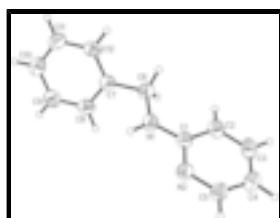

Fig. 1. The molecular structure of the title compound, showing the atomic numbering scheme. The displacement ellipsoids are drawn at the 30% probability level.

supplementary materials

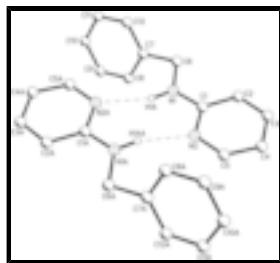

Fig. 2. The diagram of the dimer linked by the intermolecular hydrogen bonds. The H atoms not involved in hydrogen bonds have been omitted for clarity. Symmetry code: (a) $-x + 1, -y, -z$.

Data collection

Rigaku SCXmini diffractometer	1955 independent reflections
Radiation source: fine-focus sealed tube graphite	1039 reflections with $I > 2\sigma(I)$
Detector resolution: 13.6612 pixels mm ⁻¹	$R_{\text{int}} = 0.062$
CCD profile fitting scans	$\theta_{\text{max}} = 26.0^\circ$, $\theta_{\text{min}} = 3.1^\circ$
Absorption correction: multi-scan (<i>CrystalClear</i> ; Rigaku, 2005)	$h = -7 \rightarrow 7$
$T_{\text{min}} = 0.980$, $T_{\text{max}} = 0.997$	$k = -9 \rightarrow 9$
4612 measured reflections	$l = -13 \rightarrow 13$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.076$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.183$	H-atom parameters constrained
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0676P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$

1955 reflections	$(\Delta/\sigma)_{\max} < 0.001$
127 parameters	$\Delta\rho_{\max} = 0.14 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.15 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
