Supplementary Material

Characteristics

Supplementary Table S1: Summary of descriptive characteristics of the MUW external validation cohort

CR – complete response, PR – partial response, SD – stable disease, PD – progressive disease, PARPi – poly (ADP-ribose) polymerase inhibitor, MUW –Medical University of Vienna validation cohort, CT – computer tomography, FIGO – International Federation of Gynaecology and Obstetrics, rt – right side, lt – left side.

	High	9 (rt 5; lt4)	(3.69 %)
RPV output in bilateral lesions	Bilateral low (per lesion)	57 (rt 29; lt 28)	(61.96%)
(n=46 patients)	Bilateral medium (per lesion)	29 (rt 15; lt 14)	(31.52%)
	Bilateral high (per lesion)	6 (rt 2; lt 4)	(6.52%)
	Bilateral low (per RPV)	19	(41.30%)
	Bilateral medium (per RPV)	6	(13.04%)
	Bilateral high (per RPV)	-	-

Supplementary Table S2: Steps undertaken for the radiomic analysis.

1	We used the IBSI CT phantom. There are no reference values on the IBSI
	website, (from http://theibsi.github.io/ibsi1/) based on the CT phantom
2	We therefore used Pyradiomics as this is an IBSI compliant radiomic tool.
	This produced 112 features that could be used for the analysis
3	TexLAB v2 produced 666 features using one grey level, but by selecting
	all grey levels, there were 3906 features
4	42 features were identical in name and output. 4 features were identical in
	name and within 6% absolute difference
5	The following is true of features that make up the RPV vector:
	- FOS_Imedian (exact match with pyradiomics)
	- NGTDM_Contra_25HUgl (within 2% difference)
	- GLRLM_SRLGLE_25HUgl (exact match with pyradiomics)
	- FD_max_25HUgl (feature is not supportet by pyradiomics)

Supplementary Figure S1: Kaplan-Meier analysis of patient survival comparing MUW cohort with HH cohort. Progression-free survival (a) and overall survival (b). The progression-free survival at MUW showed a trend suggesting shorter PFS, but this was not statistically significant. OS was equivalent in the two cohorts.

OS – overall survival, PFS – progression free survival, MUW – Medical University of Vienna external validation cohort, HH – Hammersmith Hospital, London cohort.

Supplementary Figure S2: Boxplots illustrating the subgroup analysis of stromal content of the nine RPV-high and RPV-low lesions. For RPV-low lesions subgroups with the nine lowest calculated RPV values (RPV-lowest), and three groups (group 1-3) with a random selection of nine RPV-low calculated cases were analysed, respectively. The graph depicts the positive correlation of RPV-high with the stromal marker, fibronectin, in each subcategory. P-value = 5.869e-05 by Kruskal Wallis test.
