ABSTRACT Salmonella enterica serovar Typhimurium is a Gram-negative pathogen and a primary cause of foodborne illnesses worldwide. Here, we present the complete 47,393-bp genome sequence of the siphophage Skate, which was isolated against S. Typhimurium strain LT2.

almonella enterica serovar Typhimurium is a Gram-negative pathogen and a primary **C** cause of foodborne illnesses worldwide [\(1\)](#page-1-0). S. Typhimurium causes acute inflammatory diarrhea that can progress to invasive systemic disease [\(2\)](#page-1-1), with at least 400 deaths occurring due to acute salmonellosis every year in the United States alone [\(3\)](#page-1-2). As a control measure for S. Typhimurium, bacteriophages have garnered interest in recent years [\(4,](#page-1-3) [5\)](#page-1-4).

The phage Skate was isolated from soil in the cattle holding pen of a cattle harvesting facility in Michigan in August 2016 using S. Typhimurium strain LT2 [\(6\)](#page-1-5) as the host. Host bacteria were cultured on tryptic soy broth or agar (Difco) at 37°C with aeration. Phages were cultured and propagated by the soft agar overlay method [\(7\)](#page-1-6). The phage was identified as a siphophage using negative-stain transmission electron microscopy performed at the Texas A&M University Microscopy and Imaging Center, as previously described [\(8\)](#page-1-7). Phage genomic DNA was prepared using a modified Promega Wizard DNA cleanup kit protocol, as described previously [\(9\)](#page-1-8). Pooled indexed DNA libraries were prepared using the Illumina TruSeq Nano LT kit, and the sequence was obtained from the Illumina MiSeq platform using the MiSeq V2 500-cycle reagent kit $(2 \times 250$ -bp reads), following the manufacturer's instructions, producing 374,842 reads for the index containing the phage genome. FastQC 0.11.5 [\(https://www.bioinformatics.babraham.ac.uk/projects/](https://www.bioinformatics.babraham.ac.uk/projects/fastqc/) [fastqc/\)](https://www.bioinformatics.babraham.ac.uk/projects/fastqc/) was used for quality control of the reads. The reads were trimmed with FASTX-Toolkit 0.0.14 [\(http://hannonlab.cshl.edu/fastx_toolkit/download.html\)](http://hannonlab.cshl.edu/fastx_toolkit/download.html) before being assembled into a single contig at 160.9-fold coverage using SPAdes 3.5.0 [\(10\)](#page-1-9). Contig completion was confirmed by PCR using primers (5'-GTCGAAGCGCTACGTG AATA-3' and 5'-CTTCCCAGAGAGTCCTTTGATAC-3') facing off the ends of the assembled contig and Sanger sequencing of the resulting product, with the contig sequence manually corrected to match the resulting Sanger sequencing reads. GLIMMER 3.0 [\(11\)](#page-1-10) and MetaGeneAnnotator 1.0 [\(12\)](#page-1-11) were used to predict protein-coding genes with manual correction for appropriate gene starts, and tRNA genes were predicted with ARAGORN 2.36 [\(13\)](#page-1-12). Rho-independent termination sites were identified with TransTerm [\(http://transterm.cbcb.umd.edu/\)](http://transterm.cbcb.umd.edu/). Sequence similarity searches by BLASTp 2.2.28 [\(14\)](#page-1-13) and conserved domain searches with InterProScan 5.15-54.0 [\(15\)](#page-1-14) were used to predict protein function. All analyses were conducted using default settings via the CPT Galaxy [\(16\)](#page-1-15) and Web Apollo [\(17\)](#page-1-16) interfaces [\(https://cpt.tamu.edu/\)](https://cpt.tamu.edu/).

The Skate genome was assembled into a complete contig of 47,393 bp at 160.9-fold coverage. It has a GC content of 46%. Genes coding for proteins involved in morphogenesis, such as the major coat, capsid decoration, tail tube, tail spike, terminase large subunit, and portal proteins, were identified. A lysis cassette consisting of a class II

holin, a transglycosylase-type endolysin, and an embedded i-spanin and o-spanin pair were also identified. Genes linked to DNA replication, such as DNA primase, singlestranded DNA binding protein, DNA polymerase subunit, and an ATP-dependent helicase were found. Skate is highly similar to other *Salmonella* phages, like phage IME207 (GenBank accession number [KX523699\)](https://www.ncbi.nlm.nih.gov/nuccore/KX523699) and E1 (GenBank accession number [AM491472\)](https://www.ncbi.nlm.nih.gov/nuccore/AM491472) [\(18,](#page-1-17) [19\)](#page-1-18), sharing 58% and 55% nucleotide identity, respectively, as determined by progressiveMauve (version 2.4.0) [\(20\)](#page-1-19).

Data availability. The genome sequence of phage Skate was submitted to GenBank as accession number [MH321493.](https://www.ncbi.nlm.nih.gov/nuccore/MH321493) The associated BioProject, SRA, and BioSample accession numbers are [PRJNA222858,](https://www.ncbi.nlm.nih.gov/bioproject/PRJNA222858) [SRR8787571,](https://www.ncbi.nlm.nih.gov/sra/SRR8787571) and [SAMN11259649,](https://www.ncbi.nlm.nih.gov/biosample/SAMN11259649) respectively.

ACKNOWLEDGMENTS

This work was supported by funding from the National Science Foundation (awards EF-0949351 and DBI-1565146) and from the National Cattlemen's Beef Association and Texas Beef Cattle. Additional support came from the Center for Phage Technology (CPT), an Initial University Multidisciplinary Research Initiative supported by Texas A&M University and Texas AgriLife, and the Department of Biochemistry and Biophysics at Texas A&M University.

We are grateful for the advice and support of the CPT staff and the Texas A&M University Microscopy and Imaging Center.

This announcement was prepared in partial fulfillment of the requirements for BICH464 Phage Genomics, an undergraduate course at Texas A&M University.
