Received 16 August 2012; accepted 11 September 2012

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å; disorder in main residue;  $R$  factor = 0.066;  $wR$  factor = 0.149; data-to-parameter ratio = 17.4.

The title framework compound,  $[\text{Mg}_3(\text{C}_8\text{H}_4\text{O}_4)_3(\text{C}_3\text{H}_7\text{NO})_4]_n$  or  $[\text{Mg}_3(\text{bdc})_3(\text{DMF})_4]_n$ , was obtained as a side product of the solvothermal reaction of magnesium nitrate, terephthalic acid ( $\text{bdcH}_2$ ), and 1,3-bis(4-pyridyl)propane in a 1:2:1 ratio in dimethylformamide (DMF). The asymmetric unit consists of three  $\text{Mg}^{\text{II}}$  cations, three terephthalate anions, and four coordinating DMF molecules. One of the four DMF molecules was refined as disordered over two mutually exclusive positions, with an occupancy rate for the major moiety of 0.923 (4). The three  $\text{Mg}^{\text{II}}$  cations possess distorted octahedral coordination geometries that form linear Mg trimers. Of the three  $\text{Mg}^{\text{II}}$  cations, the central  $\text{Mg}^{\text{II}}$  is octahedrally coordinated by six different carboxylate O atoms. The terminal  $\text{Mg}^{\text{II}}$  cations are bonded to four O atoms of three  $\text{bdc}$  linkers and to two O atoms of coordinating DMF molecules. The compound has a two-dimensional  $3^6$ -network structure parallel to (001) that is formed by connection of the Mg trimers as distorted octahedral nodes to the  $\text{bdc}$  ligands as linkers.

**Poly[tetrakis(dimethylformamide)tris( $\mu_4$ -terephthalato)trimagnesium]****Vandavasi Koteswara Rao, Matthias Zeller and Sherri R. Lovelace-Cameron****Comment**

The construction of metal-organic frameworks (MOFs) with light building blocks has been the subject of intense research during the past few years (Mallick *et al.*, 2011). A suitable metal for construction of lightweight frameworks is magnesium. In the present study, the title compound,  $[\text{Mg}_3(\text{bdc})_3(\text{DMF})_4]_n$ , was obtained during part of our investigations into the solvothermal synthesis of lightweight metal organic frameworks. Reaction of magnesium nitrate with terephthalic acid ( $\text{bdcH}_2$ ) and 1,3-bis(4-pyridyl)propane (tmdpyr) at 373 K (100 °C) in dimethyl formamide (DMF) yielded the title compound as a minor product along with an unidentified white powder. The crystals of the title compound are sensitive towards solvent loss and decompose rapidly once taken out of solution.

The asymmetric unit of the title framework consists of three magnesium cations, and three anionic bdc units, and four coordinated DMF molecules, respectively (Fig. 1). One of the four DMF molecules was refined as disordered over two mutually exclusive positions with an occupancy ratio of 0.923 (4) to 0.077 (4).

The three magnesium cations in the structure form secondary building units (SBUs) that each possesses a chain of three magnesium ions bridged by six bdc linkers and coordinated by four terminal DMF molecules (Fig. 2). There are two types of magnesium coordination environments in the structure. The terminal ions, Mg1 and Mg3, in the SBU exhibit distorted octahedral geometries. Of the six bonds, four are from O atoms of three different bdc linkers (one bdc linker binds with magnesium in a chelating mode) and the other two are from DMF O atoms. The central ion, Mg2, is also distorted octahedrally coordinated, but it binds to six different carboxylate O atoms (four of them are in bidentate mode and two are in chelation mode). O—Mg—O angles vary between 60.35 (7) and 178.54 (9)°, with the unusually small angle of 60.35 (7)° being associated with the bdc linker in chelation mode. The three distorted octahedral trimeric magnesiums together act as a node that is connected with other nodes through the bdc linkers to give rise to a two-dimensional layered 3<sup>6</sup>-network (Fig. 3). The layers in the structure are stacked atop of one another, with terminal DMF molecules that are projecting into the inter-lamellar space (Fig. 4). The structure is isorecticular to previously reported magnesium and bdc based framework compounds,  $\text{Mg}_3(\text{bdc})_3(X)_4$  [ $X = \text{DMSO}$ , Rood *et al.*, 2006; DMA, Davies *et al.*, 2007] in which the terminal solvent molecules, DMSO and DMA, project in to the inter-lamellar spaces. Similar layered structures have also been reported with zinc-bdc based frameworks (Edgar *et al.*, 2001; Burrows *et al.*, 2005; Williams *et al.*, 2005; Grzesiak *et al.*, 2006).

**Experimental**

The compound was synthesized under solvothermal conditions. In a typical synthesis,  $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (0.129 g, 1.0 mmol) and terephthalic acid (0.169 g, 2.0 mmol) were dissolved in DMF (5.0 ml). Then, 1,3-bis(4-pyridyl)propane (0.101 g, 1.0 mmol) was added to the reaction mixture and stirred for one hour before transferring the mixture into a glass vial. The final mixture was heated to 373 K for 24 h. The vial was then slowly cooled to room temperature yielding colorless plates of the title compound as a minor product along with an unidentified white powder. Crystals are sensitive towards

solvent loss and decompose rapidly once taken out of solution.

## Refinement

Reflections 1 1 0, 0 1 1 and 1 0 2 were partially obstructed by the beam stop and were omitted from the refinement.

One of the DMF molecules was refined as disordered over two mutually exclusive positions. The minor moiety was restrained to have a similar geometry as the major moiety, the overlapping O and N atoms were each constrained to have ADPs identical to that in the major moiety, and the ADPs of the C, N and O atoms of the minor moiety were restrained to be similar to each other. The occupancy ratios for the two moieties refined to 0.923 (4) to 0.077 (4).

Carbon-bound hydrogen atoms were placed in calculated positions with C—H bond distances of 0.95 Å (aromatic H and carbonyl H of DMF) and 0.98 Å (methyl H). Methyl group H atoms were allowed to rotate around the C—C bond to best fit the experimental electron density.  $U_{iso}(H)$  values for all H atoms were constrained to a multiple of  $U_{eq}$  of their respective carrier atom (1.2 times for aromatic and carbonyl H atoms, and 1.5 times for methyl H atoms).

## Computing details

Data collection: *APEX2* (Bruker, 2011); cell refinement: *SAINTE* (Bruker, 2011); data reduction: *SAINTE* (Bruker, 2011); program(s) used to solve structure: *SHELXTL* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL* (Hübschle *et al.*, 2011) and *SHELXL97* (Sheldrick, 2008); molecular graphics: *DIAMOND* (Brandenburg, 2001); software used to prepare material for publication: *pubCIF* (Westrip, 2010).

**Figure 1**

View of the title framework compound with the atom numbering scheme and 50% probability displacement ellipsoids.

Symmetry operators: (i)  $-x + 1, y + 1/2, -z + 1/2$ ; (ii)  $-x, y + 1/2, -z + 1/2$ ; (iii)  $x, y - 1, z$ .

**Figure 2**

View of one trimeric SBU that acts as a node, possessing bridging carboxylates and terminal DMF molecules. For clarity, only the carboxylate groups of bdc linkers are shown and hydrogen atoms are omitted.

**Figure 3**

View of the two-dimensional 3<sup>6</sup>-net parallel to the [001] direction. Hydrogen atoms are omitted for clarity.

**Figure 4**

View of the arrangement of layers parallel to the [100] direction.

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
