Received 11 July 2011; accepted 21 July 2011

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(C-C) = 0.004$  Å;  
 $R$  factor = 0.044;  $wR$  factor = 0.104; data-to-parameter ratio = 12.1.

In the title complex,  $[Co(C_{10}H_6N_3O_4)_2(H_2O)_2]$ , the  $Co^{II}$  atom is located on an inversion centre and displays a distorted octahedral coordination geometry defined by two  $N,O$ -bidentate ligands in the equatorial plane and two water molecules in the axial positions. The conformation is stabilized by intramolecular  $O-H\cdots O$  hydrogen bonds. Intermolecular  $N-H\cdots O$  hydrogen bonds link the molecules into chains, which are further connected by intermolecular  $O-H\cdots O$  and  $O-H\cdots N$  hydrogen-bonding interactions, forming a two-dimensional supramolecular network parallel to (110).

### **Comment**

In recent years, the design and synthesis of novel metal-organic coordination polymers based on *N*-heterocyclic carboxylic acids have provoked much attention owing to their structure diversity and their potential applications as functional materials. Particular attention has been paid to the 1*H*-imidazole-4,5-dicarboxylic acid (H<sub>3</sub>IDC) ligand, because it can coordinate with metal ions in diverse coordination fashions to produce a series of complexes with different structures and interesting properties (Gu *et al.*, 2010; Wang *et al.*, 2010). In this work, a very close analogue ligand of H<sub>3</sub>IDC, 5-carboxy-2-(3-pyridyl)-1*H*-imidazole-4-carboxylate (H<sub>2</sub>PyIDC), has been chosen to prepare new coordination polymers. Up to now, only two 0D clusters (Chen, 2008; Liu *et al.*, 2009), one 1D chain (Jing *et al.*, 2011), one 2D layer (Zhou *et al.*, 2011), and one 3D network (Jing *et al.*, 2010) constructed by the H<sub>2</sub>PyIDC ligand have been reported. For example, Chen (2008) and Liu *et al.* (2009) have described the structures of the mononuclear complexes [Mn(H<sub>2</sub>PyIDC)<sub>2</sub>(H<sub>2</sub>O)<sub>2</sub>] and [Fe(H<sub>2</sub>PyIDC)<sub>2</sub>(H<sub>2</sub>O)<sub>2</sub>], in which both the manganese(II) and iron(II) ions show octahedral coordinations with the H<sub>2</sub>PyIDC ligands. A new complex [Co(H<sub>2</sub>PyIDC)<sub>2</sub>(H<sub>2</sub>O)<sub>2</sub>], (I), which is isostructural with the manganese(II) and iron(II) analogues, is presented in this paper.

As illustrated in Fig. 1, the molecule of (I) is a discrete neutral monomer, with an asymmetric unit that contains one-half of the [Co(H<sub>2</sub>PyIDC)<sub>2</sub>(H<sub>2</sub>O)<sub>2</sub>] formula unit. The Co atom lies on an inversion center and is six-coordinated with two nitrogen and two oxygen atoms from two chelating H<sub>2</sub>PyIDC ligands in the equatorial plane, and two coordinated water molecules in axial positions, forming a slightly distorted octahedral geometry. The Co–N (2.215 (2) Å) and Co–O bond distances (2.061 (2)–2.098 (2) Å) are similar to the M–O and M–N bond lengths (M = Mn, Fe) observed in the corresponding isotypic structures. The conformation of the complex is stabilized by intramolecular O—H···O hydrogen bonds. In the crystal structure, intermolecular N–H···O hydrogen bonds (Table 1) link the molecules into one-dimensional chains as shown in Fig. 2. The chains are further connected by two types of hydrogen bonds O—H···O and O—H···N involving the coordinated water molecule, the carboxylate group and the uncoordinated pyridine N atoms, resulting in a two-dimensional supramolecular network (Fig. 3).

### **Experimental**

A mixture of CoCl<sub>2</sub>·6H<sub>2</sub>O (47.6 mg, 0.2 mmol), H<sub>2</sub>PyIDC (46.6 mg, 0.2 mmol), 8 ml H<sub>2</sub>O, and 0.1 mL Et<sub>3</sub>N was sealed in a 15 mL Teflon-lined stainless steel autoclave, heated at 443 K for 72 h, and then slowly cooled to room temperature at a rate of 5 K h<sup>-1</sup>. Brown block-shaped crystals of (I) were obtained with a yield of 28% after washing with distilled water and drying in air.

## Refinement

Water H atoms were located in a difference Fourier map and refined with distance restraints of O—H = 0.85 Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{O})$ . Other H atoms were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic), O—H = 0.82 Å and N—H = 0.86 Å with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C}, \text{N})$  or  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$ .

## Figures

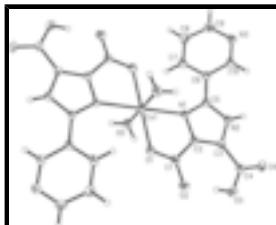

Fig. 1. The molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level. Unlabelled atoms are related to the labelled atoms by the symmetry operation 2-x, -y, 1-z.

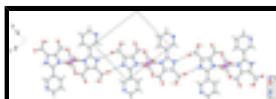

Fig. 2. Crystal packing of the title compound viewed down the  $a$  axis, showing the one-dimensional chain structure. Hydrogen bonds are shown as dashed lines.

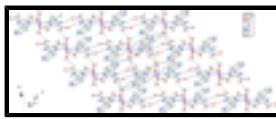

Fig. 3. Crystal packing of the title compound showing the two-dimensional hydrogen-bonding network (dashed lines).

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.044$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.104$	H-atom parameters constrained
$S = 1.06$	$w = 1/\sigma^2(F_o^2) + (0.0385P)^2 + 0.3865P$ where $P = (F_o^2 + 2F_c^2)/3$
2052 reflections	$(\Delta/\sigma)_{\max} < 0.001$
170 parameters	$\Delta\rho_{\max} = 0.30 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.33 \text{ e \AA}^{-3}$

## *Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
