Received 8 August 2013; accepted 16 August 2013

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.053; wR factor = 0.137; data-to-parameter ratio = 15.6.

In the title compound, $[\text{Fe}(\text{C}_5\text{H}_5)(\text{C}_{33}\text{H}_{25}\text{BrN}_3\text{O})]$, the fused four-ring system, 11*H*-indeno[1,2-*b*]quinoxaline is essentially planar, with a maximum deviation of 0.087 (3) Å from the least-squares plane of the attached benzene ring. The pyrrolidine rings adopt envelope conformation and make a dihedral angle of 51.76 (19)° with each other. The cyclopenta-diene rings of the ferrocenyl moiety have an eclipsed conformation. The Br atom deviates by 0.0190 (9) Å from the attached benzene ring. The molecular structure features an intramolecular C–H···N interaction, which generates an *S*(8) ring motif. The crystal packing features C–H···O interactions, which generate $R_2^2(18)$ centrosymmetric dimers, as well as C–H···π interactions.

2-(4-Bromobenzoyl)-1-ferrocenylspiro[11*H*-pyrrolidizine-3,11'-indeno[1,2-*b*]quinoxaline]

Sivasubramanian Suhitha, Krishnaswamy Gunasekaran, Adukamparai Rajukrishnan Sureshbabu, Raghavachary Raghunathan and Devadasan Velmurugan

1. Comment

Biological activities like antimalarial, antifungal (Biot *et al.*, 2004), antitumor (Jaouen *et al.*, 2004), and antibacterial (Fouda *et al.*, 2007) are well known for ferrocene containing compounds. The information of molecular conformation and crystal packing of the title compound were obtained and analyzed using X-ray diffraction study against this background.

In the title compound, the four fused ring system, 11*H*-indeno[1,2-*b*]quinoxaline is essentially planar with a maximum deviation of -0.087 (3) Å for C8 atom. The pyrrolidine ring (N3/C16–C19) adopts a C17-*envelope* conformation with C17 -0.230 (4) Å out of the mean plane formed by the remaining ring atoms. The pyrrolidine ring (N3/C8/C19–C21) adopts a C21-*envelope* conformation with C21 -0.211 (3) Å out of the mean plane formed by the remaining ring atoms; the pyrrolidine rings make a dihedral angle of 51.76 (19)° with each other. The pyrrolidine ring (N3/C8/C19/C20/C21) makes a dihedral angle of 87.40 (18)° with the cyclopentane ring (C7-C11) which shows they are almost orthogonal to each other. The dihedral angle between the cp rings in the ferrocene moiety is 4.8 (2) °, which shows that they are almost coplanar to each other. The bromine atom Br1 attached with the benzenel ring (C23-C28) deviates by 0.0190 (9) Å.

The molecular structure is stabilized by C28—H28···N2 intramolecular interaction, which generates a *S*(8) ring motif (Fig. 1). The crystal packing is stabilized by inter-molecular C13—H13···O1¹ interactions, which generate *R*²(18) centrosymmetric dimers (Bernstein *et al.*, 1995) (Fig. 2). The crystal packing is further stabilized by inter-molecular C4—H4···Cg1, C17—H17B···Cg2 and C36—H36···Cg3 inter-molecular interactions, where Cg1, Cg2 and Cg3 are the centers of gravity of rings (C29–C33), (C9–C15) and (N1/N2/C1/C6/C7/C11), respectively (Table 1).

2. Experimental

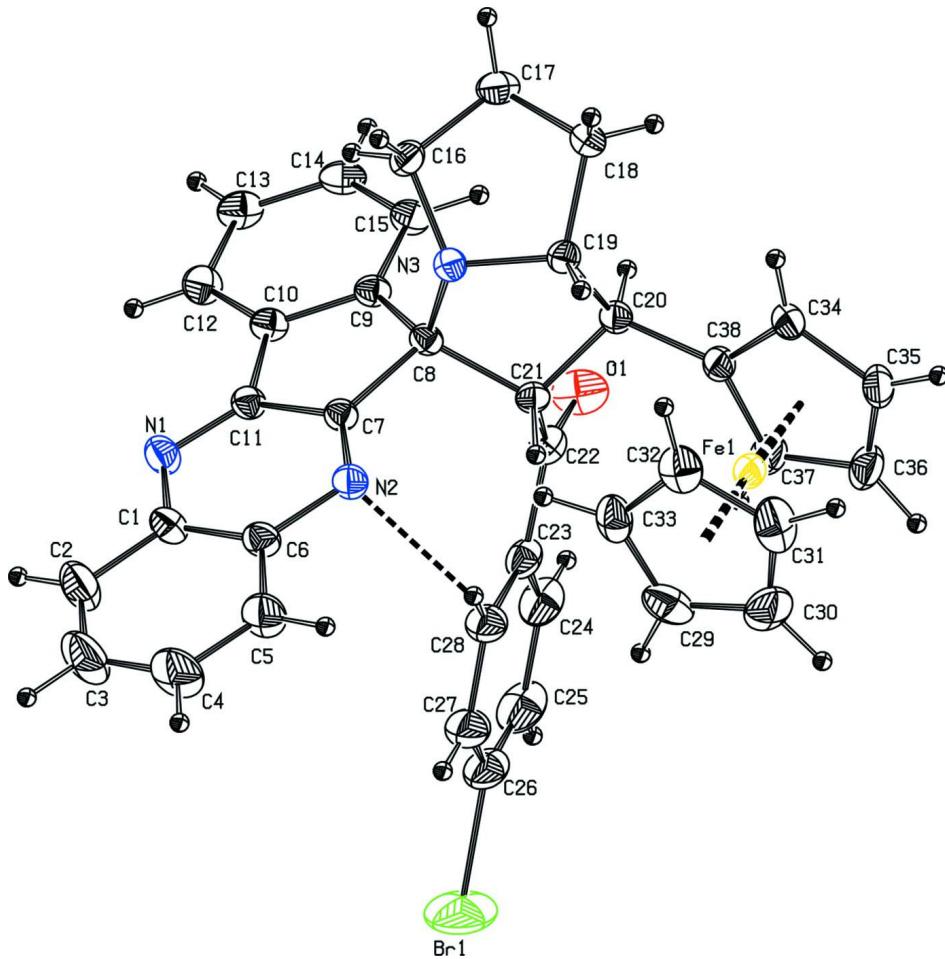

Ninhydrin (1 mM) and 1, 2-phenylenediamine (1 mM) were mixed and stirred with 10 mL of methanol for 10 min. To this mixture proline (1 mM) and 1-ferrcenyl- 3-(4-bromo)benzoyl-prop-2-ene dipolarophile (1 mM) were added and was refluxed up to the end of the reaction as observed by TLC. The solvent content from the mixture was removed under reduced pressure and the crude product was obtained. Using column chromatography the crude extract was purified by petroleum ether and ethyl acetate (4:1). Finally, single crystals suitable for the X-ray diffraction were obtained by slow evaporation at room temperature.

3. Refinement

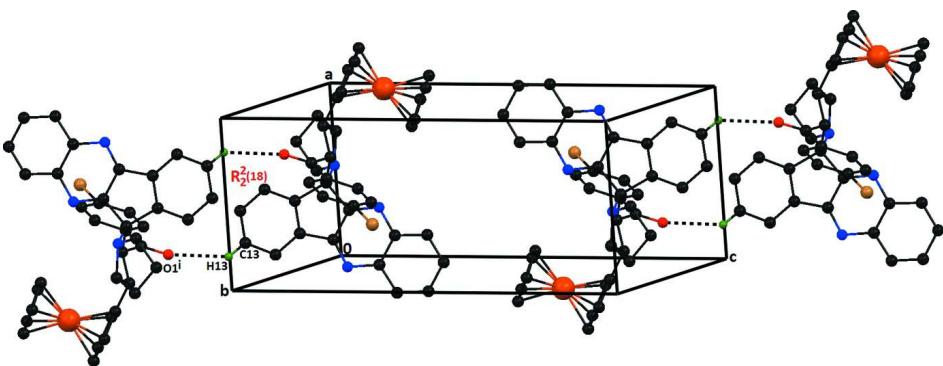

Hydrogen atoms were placed in calculated positions with C—H ranging from 0.93 Å to 0.98 Å and refined using the riding model approximation with a fixed isotropic displacement parameter $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1, Cg2 and Cg3 are the centroids of the C29—C33, C9—C15 and N1/N2/C1/C6/C7/C11 rings, respectively.
