Received 7 October 2010; accepted 5 November 2010

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.006$ Å; R factor = 0.038; wR factor = 0.028; data-to-parameter ratio = 16.7.

In the binuclear title compound, $[Mo_2(C_{12}H_{15}N_4O_2)_2Cl_2O_3] \cdot H_2O$, the complex molecules have approximate C_2 symmetry. Both Mo^V atoms have a distorted octahedral coordination environment with *cis*-positioned terminal chloride and oxide groups. The heteroscorpionate organic ligand binds to the Mo^V atom *via* an N_2O donor set. The water molecule bridges two complex molecules, forming O—H···O and O—H···Cl hydrogen bonds to the acetate group and to the chloride ligands.

Related literature

The preparation of the first ‘scorpionate’ complex was described by Trofimenko (1967). For the importance of the structures of Mo(VI/V/IV) complexes related to the Mo-enzymes, see: Hille (1996); Heinze & Fischer (2010). For complexes with $\kappa^3 N, N', O$ -bound heteroscorpionate ligands, see: Otero *et al.* (2004); Burzlaff (2008); Kitanovski *et al.* (2006). For Mo complexes with bis(3,5 dimethyl-1H-pyrazol-1-yl)acetate ligands, see: Kitanovski *et al.* (2006); Hammes *et al.* (2004). For the weighting scheme used in the refinement, see: Wang *et al.* (1985)

**μ -Oxido-bis{[2,2-bis(3,5-dimethyl-1H-pyrazol-1-yl)acetato-
 κ^3N^2,O,N^2']chloridooxidomolybdenum(V)} monohydrate**

A. Golobic and B. Ceh

Comment

Since the preparation of the first tris(pyrazolyl)borate-complexes by Trofimenko (1967) the coordination compounds of almost all transition elements with different "scorpionate" ligands have been prepared. The characteristics and the synthetic routes of divers tripodal heteroscorpionate N,N,O-, N,N,S- and, N,N,N- ligands based on bis(pyrazol-1-yl)acetate, -thioacetate and -ethoxide with pyrazolyl rings substituted at 3 and 5 positions, as well as their complexes with different metals have been discussed. (Otero *et al.*, 2004). For some time afterwards, the complexes with metal atoms coordinated with tripodal κ^3N,N',O -bound "scorpionate" ligands have attracted considerable interest because they can serve as structural models, mimicking the active sites like, for example, the 2-His-1-carboxylate triad, which is present in different metalloenzymes and -proteins, mostly containing Zn, Fe, Mn, Ni, Co and Mo atoms (Burzlaff, 2008). The mononuclear molybdenum-containing enzymes serve for catalyzing of a net oxygen atom transfer with the Mo atom cycling between +4 and +6 oxidation states (Hille, 1996). The elucidation of the structures of mononuclear Mo(VI/V/IV) complexes can help the understanding of interaction of the intermediate, and resting states of these enzymes (Heinze & Fischer, 2010). The complexes with di-1*H*-pyrazol-1-ylacetate, substituted at the 3 and 5 positions, are known with more than a half of d-elements in different oxidation states (Kitanovski *et al.*, 2006). Some Mo(VI), and Mo(V) complexes with bdmpza as ligand have already been prepared so far (Hammes *et al.*, 2004; Kitanovski *et al.*, 2006).

The compound crystallizes in the orthorhombic space group Pbca with eight binuclear complex molecules and eight water molecules per unit cell. Both MoCl(O)(bdmpza) moieties are symmetry independent. The Mo1—O1 and Mo2—O2 bond lengths are 1.675 (3) and 1.674 (3) Å, and the Mo1—Cl1 and Mo2—Cl2 bond distances are 2.3594 (11) and 2.3759 (11) Å, respectively. With respect to the nonlinear Mo—O—Mo bridge (178.31 (16) $^\circ$), the Mo=O vectors in the binuclear unit adopt an anti-orientation (torsion angle O1—Mo1—Mo2—O2 is 175.59 (14) $^\circ$), and the Mo—Cl vectors an approximate *cis*-orientation (torsion angle Cl1—Mo1—Mo2—Cl2 is -31.01 (4) $^\circ$). The O-atom of Mo=O and the coordinated O-atom of the acetate group are in *trans*-position (O1—Mo1—O1a 164.75 (12) and O2—Mo2—O1c 165.25 (12) $^\circ$). Both central atoms have a significantly distorted octahedral coordination, caused in first line by a typically low angles between κ^3N,N',O -coordination bonds with Mo-atom (between 78.28 (11) and 81.07 (12) $^\circ$ for Mo1, and between 78.09 (10) and 80.90 (11) $^\circ$ for Mo2). The high values are also observed between Mo=O and Mo—Cl bonds (102.86 (10) $^\circ$ for Mo1 and 102.51 (10) $^\circ$ for Mo2, respectively). The solvate water acts as a donor of two weak hydrogen bonds accepted by the uncoordinated O2c of the acetate ligand from the same asymmetric unit (with O1w···O2c distance 2.889 (8) Å and Cl2 from symmetry related unit (with O1w···Cl2(x,3/2 - y,1/2 + z) distance 3.335 (7) Å).

Experimental

A mixture of MoCl₄(CH₃CN)₂ (0.450 mg, 1.40 mmol), Hdmpza (0.347 g, 1.40 mmol) and acetonitrile (20 ml) was stirred at room temperature. At first the mixture became clear and after an hour the orange precipitate started to separate. After the filtration of the precipitate, a small amount of water (0.13 g) was added to the portion of filtrate (0.65 g) and the solution

supplementary materials

left on air at room temperature. After about 14 h the black crystals, suitable for X-ray diffraction started to grow and were isolated in 45% yield. Anal. Calcd. for $C_{24}H_{32}Cl_2N_8O_8$: C, 35.01; H, 3.92; N, 13.61. Found: C, 35.74; H, 4.03; N, 13.71.

Refinement

Full matrix least-squares refinement on F values with anisotropic displacement parameters for all non-hydrogen atoms was employed. Hydrogen atoms were located from difference Fourier maps. Their parameters were not refined. A REGINA (Wang *et al.*, 1985) weighting scheme using the normal equation of the second order was applied for individual reflections so that $w = A(0,0) + A(1,0)V(F) + A(0,1)V(S) + A(2,0)V(F)^2 + A(0,2)V(S)^2 + A(1,1)V(F)V(S)$, where $V(F) = F_{\text{obs}}/F_{\text{obs(max)}}$, $F_{\text{obs(max)}} = 496.47$ and $V(S) = (\sin\theta/\lambda)/((\sin\theta/\lambda)(\text{max}),(\sin\theta/\lambda)(\text{max})) = .6495$. The parameters were: $A(0,0) = 110.7607$, $A(1,0) = .7072179$, $A(0,1) = -502.5041$, $A(2,0) = -.0004053$, $A(1,1) = -1.637116$, $A(0,2) = 576.1985$. The location of the deepest hole is at the site of Mo₂ atom.

Figures

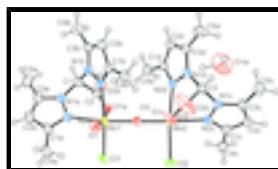

Fig. 1. ORTEP drawing of the asymmetric unit of the title compound, showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 40% probability level and H atoms are drawn as small spheres of arbitrary radii.

C1c—C2c—C3c	107.5 (4)	H52d—C5d—H53d	109.62
C1d—C2d—C3d	107.5 (4)	H51d—C5d—H52d	108.63

Hydrogen-bond geometry (\AA , $^\circ$)

$D\text{—H}\cdots A$	$D\text{—H}$	$H\cdots A$	$D\cdots A$	$D\text{—H}\cdots A$
O1w—H1w…O2c	1.02	2.23	2.889 (8)	121
O1w—H2w…Cl2 ⁱ	1.00	2.42	3.335 (7)	151

Symmetry codes: (i) $x, -y+3/2, z+1/2$.
