Appendix 2. Newcastle-Ottawa Scale assessment scale

For cross sectional studies

Selection: (Maximum 4 stars)

- 1) Representativeness of the sample:
 - a) Truly representative of the average in the target population (all subjects or random sampling). *
 - b) Somewhat representative of the average in the target population (non-random sampling). *
 - c) Selected group of users.
 - d) No description of the sampling strategy.
- 2) Sample size:
- a) Justified and satisfactory (> 1000). *
- b) Not justified.
- 3) Non-respondents:
 - a) Comparability between respondents and non-respondents characteristics is established, and the response rate is satisfactory. *
 - b) The response rate is unsatisfactory, or the comparability between respondents and non-respondents is unsatisfactory.
 - c) No description of the response rate or the characteristics of the responders and the non-responders.
- 4) Ascertainment of the exposure (risk factor):
 - a) Validated measurement tool. *
 - b) Non-validated measurement tool, but the tool is available or described. $\ensuremath{^*}$
 - c) No description of the measurement tool.

Comparability: (Maximum 2 stars)

- 1) The subjects in different outcome groups are comparable, based on the study design or analysis. Confounding factors are controlled.
 - a) The study controls for the most important factor (age, and gender). *
 - b) The study control for any additional factor (outdoor activity/outdoor time). *

Outcome: (Maximum 3 stars)

- 1) Assessment of the outcome:
 - a) Independent blind assessment. **
 - b) Record linkage. *
 - c) Self report.
 - d) No description.
- 2) Statistical test:
- a) The statistical test used to analyze the data is clearly described and appropriate, and the
- © 2025 Ha A et al. JAMA Network Open.

measurement of the association is presented, including confidence intervals and the probability level (p value). *

b) The statistical test is not appropriate, not described or incomplete.

For cohort studies

Selection: (Maximum 4 stars)

- 1) Selection of the non exposed cohort:
 - a) truly representative of the average children and adolescents in the community. *
 - b) somewhat representative of the average <u>children and adolescents who are less likely to use screen devices</u> (describe) in the community. *
 - c) selected group of users eg nurses, volunteers.
 - d) no description of the derivation of the cohort.
- 2) Selection of the non exposed cohort:
 - a) drawn from the same community as the exposed cohort. *
 - b) drawn from a different source.
 - c) no description of the derivation of the non exposed cohort.
- 3) Ascertainment of exposure:
 - a) secure record (eg. Surgical records). *
 - b) structured interview. *
 - c) written self repot.
 - d) no description.
- 4) Demonstration that outcome of interest was not present at start of study:
 - a) yes. *
 - b) no.

Comparability: (Maximum 2 stars)

- 1) Comparability of cohorts on the basis of the design or analysis:
 - a) The study controls for the most important factor (age, and gender). *
 - b) The study control for any additional factor (outdoor activity/outdoor time). *

Outcome: (Maximum 3 stars)

- 1) Assessment of the outcome:
 - a) Independent blind assessment. *
 - b) Record linkage. *
 - c) Self report.
- © 2025 Ha A et al. JAMA Network Open.

- d) No description.
- 2) Was follow-up long enough for outcomes to occur:
 - a) yes (select an adequate follow up period for outcome of interest). *
 - b) no.

Adequacy of follow up of cohorts:

- a) complete follow up all subjects account for. *
- b) subjects lost to follow up unlikely to introduce bias small number lost > 90 % follow up, or description provided of those lost). *
- c) follow-up rate < 90 % and no description of those lost.
- d) no statement

eMethods. Methods for converting effect sizes

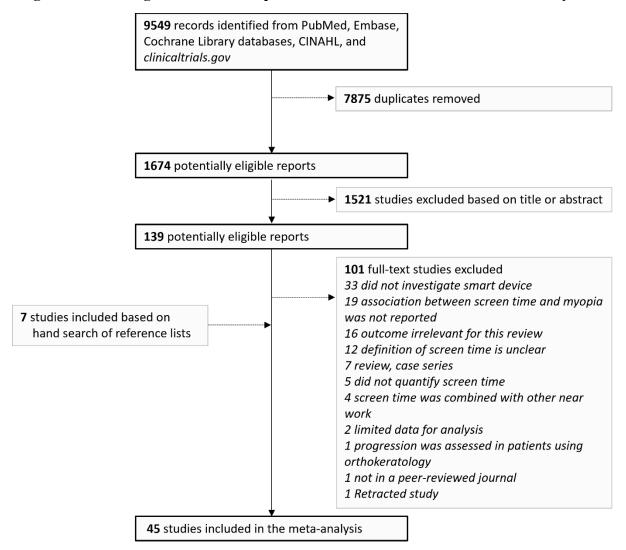

$Odds\ ratio = e^{b1}$

We applied the methodology used in the previous meta-analysis to convert regression coefficient to odds ratio. When a logistic regression is calculated, the regression coefficient (b1) is the estimated increase in the log odds of the outcome per unit increase in the value of the exposure. ²

Appendix 4. List of articles excluded at full-text screening stage

Author	Year	Study title	Reason for exclusion
Foster et al	2010	Refractive error, axial length and anterior chamber depth of the eye in British adults: the EPIC-Norfolk Eye Study.	Did not investigate smart devices
Borchert et al	2011	Risk factors for hyperopia and myopia in preschool children the multi-ethnic pediatric eye disease and Baltimore pediatric eye disease studies	Did not investigate smart devices
Gao et al	2011	Prevalence and characteristics of myopic retinopathy in a rural Chinese adult population: The Handan Eye Study.	Did not investigate myopia and smart devices
Chen et al	2012	Prevalence and associated risk factors of myopic maculopathy in elderly Chinese: The Shihpai eye study.	Did not investigate myopia and smart devices
Asakuma et al	2012	Prevalence and risk factors for myopic retinopathy in a japanese population: The hisayama study.	Did not investigate myopia (investigated myopic retinopathy instead) and smart devices
French et al	2013	Risk factors for incident myopia in Australian schoolchildren: The Sydney Adolescent Vascular and Eye Study	Did not investigate myopia and smart devices
Cheng et al	2013	Myopization factors affecting urban elementary school students in Taiwan	Did not investigate myopia and smart devices
Bastawrous et al	2013	Prevalence and predictors of refractive error and spectacle coverage in Nakuru, Kenya: a cross-sectional, population-based study	Did not investigate smart devices
Hsu et al	2016	Prevalence and risk factors for myopia in second- grade primary school children in Taipei: A population-based study	Digital screen time was categorized only as yes or no and was not quantified
Tsai et al	2016	Myopia Development Among Young Schoolchildren: The Myopia Investigation Study in Taipei	The association between screen time and myopia was not reported
Ansar et al	2016	Risk factors for refractive errors among school going childrens in Wah Cantonment, Rawalpindi, Pakistan.	Did not investigate smart devices
Czepita et al	2017	The Influence of Environmental Factors on the Prevalence of Myopia in Poland.	Screen time and near work activities, such as reading and writing, were analyzed together
Anamarina and Daniela-Edith	2017	Development and progression of refractive errors in medical students.	Irrelevant
Terasaki et al	2017	Association of lifestyle and body structure to ocular axial length in Japanese elementary school children	Only Spearman's correlation analysis was reported
Hsu et al	2017	Risk factors for myopia progression in second- grade primary school children in Taipei: a population-based cohort study	Digital screen time was categorized only as yes or no and was not quantified
Ding et al	2018	Risk factors of myopia boom in young generation in China 'The Guangzhou Twin Eye Study	Did not specify near work

2018	Possible causes of discordance in refraction in monozygotic twins: Nearwork, time outdoors and stochastic variation.	Did not investigate smart devices
2018	Refraction and change in refraction over a 20- year period in the beaver dam eye study	Did not investigate smart devices
2018	Environmental factors associated with ocular morbidity among children in three ecological regions of Nepal: a phase II Nepal Pediatric Ocular Diseases Study	Myopia lumped together as refractive error and did not investigate smart devices
2018	Parental attitudes to myopia: a key agent of change for myopia control?	The association between screen time and myopia was not reported
2018	Refractive error among male primary school students in Jazan, Saudi Arabia: Prevalence and associated factors.	Did not investigate smart devices
2018	The Influence of Parental Myopia on Children's Myopia in Different Generations of Parent-Offspring Pairs in South Korea.	Did not investigate smart devices
2019	Prevalence of myopia and associated risk factors in medical students in Monterrey	Did not investigate smart devices
2019	Prevalence and risk factors of refractive errors among preparatory school students in Beni-Suef,	Did not investigate smart devices
2019	The spatial frequency content of urban and indoor environments as a potential risk factor for myopia development	Did not investigate smart devices
2020	Racial and Ethnic Differences in Myopia Progression in a Large, Diverse Cohort of Pediatric Patients	Investigated the analytical model best describing myopia progression
2020	Association between Time Spent on Smart Devices and Change in Refractive Error: A 1-Year Prospective Observational Study among Hong Kong Children and Adolescents	Only the differences in spherical equivalent change were reported.
2020	Dependence of the progression rate of myopia	Did not investigate smart devices
2020	The prevalence and predictors of refractive error among school children in Riyadh, Saudi Arabia	Digital screen time was categorized only as yes or no and was not quantified
2020	Annual myopia progression and subsequent year progression in Singaporean children	Did not investigate smart devices
2020	Epidemiology of refractive and associated factors in school-aged children in Xiangtan	Did not investigate smart devices
2020	The prevalence of myopia and factors associated with it among secondary school children in rural Vietnam	Did not investigate smart devices
2020	Sleeping late is a risk factor for myopia development amongst school-aged children in China	Did not investigate smart devices
2020	The biophysical efficacy of smart phones on the eyes of children from 3-12 years	The association between screen time and myopia was not reported
2020	Prevalence and influencing factors of myopia in adolescents and children in Gaoping, Shanxi Province	Did not investigate smart devices
2020	Effect of Genetic-Environmental Interaction on Chinese Childhood Myopia	Did not investigate smart devices
