### Background

Over the last decade, we have shown that cGMP, derived from bradykinin, nitric oxide (NO•, both from endogenous and exogenous sources) or natriuretic peptides, is a potent inhibitor of cardiac hypertrophy, across isolated cardiomyocytes and intact hearts both *ex vivo* and *in vivo*. However, NO• bioavailability is reduced due to scavenging by ROS; furthermore, oxidation of sGC may result in sGC dysfunction (including loss of responsiveness to NO•). In the present study, we tested the hypothesis that the NO•-independent sGC stimulator BAY 41-2272 and the NO-independent sGC activator BAY 58-2667 elicit powerful antihypertrophic actions.

### Materials and methods

Neonatal rat cardiomyocytes were incubated at 37°C in the presence of the hypertrophic stimulus, endothelin-1 (ET<sub>1</sub>, 60 nM) ± BAY 41-2272 or BAY 58-2667 (0.01–0.3 μM) for 48 h in serum-free conditions. Cardiomyocyte hypertrophy was assessed in live cells using conventional *in vitro* markers of hypertrophy, two dimensional area and cardiomyocyte *de novo* protein synthesis. Results were expressed as % paired control cardiomyocytes, mean ± SE.

### Results

See Table 1.

### Conclusion

These results provide evidence that BAY 41-2272 and BAY 58-2667 elicit concentration-dependent inhibition of cardiac hypertrophy *in vitro*, in the absence of confounding haemodynamic factors and even at low (submicromolar) concentrations. These novel NO•-independent sGC ligands thus potentially may serve as useful antihypertrophic agents in patients, independent of blood pressure.

**Table 1: sGC ligands inhibit cardiomyocyte hypertrophy**

	Control	ET <sub>1</sub> alone	ET <sub>1</sub> + BAY (0.01 μM)	ET <sub>1</sub> + BAY (0.03 μM)	ET <sub>1</sub> + BAY (0.10 μM)	ET <sub>1</sub> + BAY (0.30 μM)
Cell size (% paired control cardiomyocytes, both n = 4)						
BAY 41-2272	100 ± 0%	146 ± 9%*	128 ± 5%#	116 ± 7%#	106 ± 6%#	108 ± 6%#
BAY 58-2667	100 ± 0%	141 ± 8%*	133 ± 11%	123 ± 7%#	113 ± 2%#	108 ± 12%
De novo protein synthesis (% paired control cardiomyocytes, n = 5-6)						
BAY 41-2272	100 ± 0%	122 ± 1%*	102 ± 1%#	101 ± 1%#	102 ± 2%#	110 ± 0%#
BAY 58-2667	100 ± 0%	135 ± 2%*	110 ± 3%	117 ± 3%	107 ± 2%#	108 ± 3%

\*p < 0.05 versus control; #p < 0.05 versus ET<sub>1</sub>, on one-way RM. DMSO, the vehicle for the sGC ligands, had no effect on either parameter either alone, or in the presence of ET<sub>1</sub>.
