Abstract: In the past, Native Americans of North America had an abundant traditional herbal legacy for treating illnesses, disorders, and wounds. Unfortunately, much of the ethnopharmacological knowledge of North American Indians has been lost due to population destruction and displacement from their native lands by European-based settlers. However, there are some sources of Native American ethnobotany remaining. In this work, we have consulted the ethnobotanical literature for members of the Asteraceae used in Cherokee and other Native American traditional medicines that are native to the southeastern United States. The aerial parts of *Eupatorium serotinum*, *Eurybia macrophylla*, *Eutrochium purpureum*, *Polymnia canadensis*, *Rudbeckia laciniata*, *Silphium integrifolium*, *Smallanthus uvedalia*, *Solidago altissima*, and *Xanthium strumarium* were collected from wild-growing plants in north Alabama. The plants were hydrodistilled to obtain the essential oils and the chemical compositions of the essential oils were determined by gas chromatography–mass spectrometry. The essential oils were tested for in-vitro antifungal activity against *Aspergillus niger*, *Candida albicans*, and *Cryptococcus neoformans*. The essential oil of *E. serotinum* showed noteworthy activity against *C. neoformans* with a minimum inhibitory concentration (MIC) value of 78 µg/mL, which can be attributed to the high concentration of cyclocolorenone in the essential oil.

Keywords: ethnopharmacology; essential oil; chemical composition; *Cryptococcus neoformans*; cyclocolorenone

1. Introduction

Many aspects of modern medicine have relied on the traditional knowledge of native cultures, including, for example, traditional Indian medicine (Ayurveda) [1], traditional Chinese medicine (TCM) [2], and traditional Islamic medicine [3]. Unfortunately, many of the traditional uses of medicinal plants are being lost due to several reasons. Recent generations are less interested in traditional knowledge, and habitat destruction and forced migration have reduced access to medicinal plants. The Native Americans of North America also had rich traditions of medicinal plant use. However, much of this knowledge has been lost due to population declines and displacement from native lands. Nevertheless, there are still some existing references to the ethnobotanical uses of medicinal plants by Native Americans [4].

Eupatorium serotinum Michx., “late boneset”, is native to eastern North America and ranges from Texas, Oklahoma, and Kansas, to the Atlantic coast and from the Gulf of Mexico north to Wisconsin and Michigan [5]. The Houma people of Louisiana used a decoction of the flowers to treat typhoid fever [6]. Extracts of the aerial parts of *E. serotinum* have yielded germacranolide sesquiterpenoids [7,8].

Eurybia macrophylla (L.) Cass. (syn. *Aster macrophyllus* L.), “bigleaf aster”, is native to southeastern Canada and northeastern United States, as far south as north Alabama and north Georgia [9]. The Iroquois used a decoction of the roots as a blood medicine and to treat venereal disease; the Ojibwa people ate the leaves of *E. macrophylla* as a medicine and food [6].

Eutrochium purpureum (L.) E.E. Lamont (syn. *Eupatorium purpureum* L.), “purple Joe-Pye weed”, ranges from central to eastern North America, from the Great Lakes region south to the Gulf of Mexico [10]. The Cherokee used the roots as a treatment for rheumatism, for kidney problems, and for “female problems”; the Chippewa inhaled the vapors from an infusion of the plant for colds; the Navajo used the plant as an antidote for poison; and the Potawatomi people applied a poultice of the leaves on burns [6].

Polymnia canadensis L., “white flower leafcup”, is found in eastern North America from Alabama and Georgia north to Ontario, and from Kansas and Oklahoma east to the Appalachians and New York [11]. The Houma people applied a poultice of the crushed leaves to swellings; the Iroquois used the plant to relieve toothache [6]. Extracts of the aerial parts of *P. canadensis* have yielded diterpenoid carboxylic acids and germacranolides [12].

Rudbeckia laciniata L., “cutleaf coneflower”, is widespread in the United States and Canada [13]. There are eight varieties of *R. laciniata*, namely *ampla*, *bipinnata*, *digitata*, *gasperiensis*, *heterophylla*, *hortensia*, *humilis*, and *laciniata* [14]; *R. laciniata* var. *laciniata* is the common variety found in eastern North America [15]. The Cherokee ate the cooked greens to “keep well”, while the Chippewa applied a poultice of the flowers to treat burns [6]. Several lignans, flavonoid glycosides, and quinic acid derivatives have been isolated from the aerial parts of *R. laciniata*, and sesquiterpenoids have been isolated from root extracts [4].

Silphium integrifolium Michx., “whole-leaf rosinweed”, ranges from Wisconsin and Michigan, south through Alabama and Mississippi, and west as far as New Mexico [16]. An infusion of the leaves of *S. integrifolium* was taken by the Meskwaki people for “bladder troubles” [6]. Flavonoids, oleanolic acid glycosides, and phenolic acids have been identified in the aerial parts of *S. integrifolium* [17].

Smallanthus uvedalia (L.) Mack. (syn. *Polymnia uvedalia* (L.) L.), “yellow flower leafcup”, is found in the southeastern United States from Virginia to Florida, west to eastern Texas and Oklahoma [18]. The Cherokee used the bruised roots on burns and cuts; the Iroquois took an infusion of the shoots and roots to treat back pain and vomiting [6]. The plant is the source of several germacranolide sesquiterpenoids and *ent*-kaurane diterpenoids [4].

Solidago altissima L. (syn. *Solidago canadensis* L.), “Canada goldenrod”, ranges across most of North America from Canada to northern Mexico [19]. The Okanagan-Colville and the Thompson tribes used an infusion of the roots and shoots of *S. altissima* to treat fevers [6], and the Cherokee took an infusion of *Solidago* spp. to treat fevers. The phytochemistry of *S. canadensis* has been extensively studied and found to contain saponins [20,21], flavonoids [22–24], polyacetylenes [25,26], diterpenoids [27], and triterpenoids [28].

Xanthium strumarium L., “rough cocklebur”, ranges throughout North America and is considered a noxious weed in the southeastern United States [29]. The White Mountain Apache tribe took a root decoction to treat fevers; the Mahuma people of Southern California used the plant to treat rheumatism, tuberculosis, and gonorrhea [6]. The aerial parts of *X. strumarium* contain alkaloids, sesquiterpene lactones (guianolides, germacranolides, and elemanolides), phenolic compounds, and the toxic carboxylic acid atracyloside, a kaurene glycoside [30].

We have had an interest in the volatile chemistry and biological activity of Native American medicinal plants [31–42], including members of the Asteraceae [43–45]. As part of our continuing investigations, the purpose of this work was to seek out additional species of Asteraceae important in Native American traditional medicine growing wild in northern Alabama and to obtain the essential oils by hydrodistillation of the aerial parts. As a test for biological activity, the essential oils were then screened for antifungal activity against three potentially pathogenic fungal strains. *Aspergillus niger*, *Candida albicans*, and *Cryptococcus neoformans* are the causative agents of opportunistic *Aspergillus* lung disease, candidiasis, and cryptococcosis, respectively.

2. Results and Discussion

The essential oils from *E. serotinum*, *E. macrophylla*, *E. purpureum*, *P. canadensis*, *R. laciniata*, *S. integrifolium*, *S. uvedalia*, *S. altissima*, and *X. strumarium* were obtained from the fresh aerial parts of the plants by hydrodistillation, generally in low yield. The essential oils were analyzed by GC and GC-MS (Tables 1, 3–9, and 11).

2.1. *Eupatorium serotinum* Michx.

The essential oil from the aerial parts of *E. serotinum* was rich in sesquiterpenoids, with cyclocolorenone (23.38%), germacrene D (6.58%), and palustrol (5.32%), along with an unidentified sesquiterpenoid (5.72%) as the major components (Table 1).

Table 1. Chemical composition of the essential oil of *Eupatorium serotinum* Michx.

To our knowledge, there have been no previous reports on the essential oil composition of *E. serotinum*. The phytochemistry of the genus *Eupatorium* has been reviewed [46] and there have been numerous reports on the essential oil compositions from other species of the genus (Table 2). There is much variability in the essential oil compositions of *Eupatorium* species, both between species and within species. Nevertheless, sesquiterpenoids often dominate the essential oils of *Eupatorium* species.

Table 2. Major components and biological activities of *Eupatorium* essential oils.

<i>Eupatorium</i> spp. Essential Oil	Location	Major Components	Biological Activity	Ref.
<i>E. adenophorum</i> (aerial parts)	Nainital, India	camphene (8.9%), <i>p</i> -cymene (16.6%), bornyl acetate (15.6%), amorph-4-en-7-ol (9.6%), α -cadinol (6.2%), amorpha-4,7(11)-dien-8-one (7.8%)	none reported	[47]
<i>E. adenophorum</i> (leaves)	Palampur, India	bornyl acetate (9.0%), germacrene D (5.7%), β -bisabolene (6.2%), 1-naphthalenol (17.5%), α -bisabolol (9.5%)	Antibacterial (<i>Rhodococcus rhodochrous</i> , MBC 12.5 μ L/mL)	[48]
<i>E. adenophorum</i> (twigs)	Uttar Pradesh, India	camphene (12.1%), α -phellandrene (8.6%), α -terpinene (6.5%), <i>p</i> -cymene (11.6%), bornyl acetate (10.6%), acoradiene (10.1%), α -bisabolol (5.3%)	Antibacterial (<i>Erwinia herbicola</i> , MIC 0.25 μ L/mL; <i>Pseudomonas putida</i> , MIC 2.0 μ L/mL)	[49]
<i>E. adenophorum</i> (inflorescence)	Palampur, India	bornyl acetate (6.3%), β -caryophyllene (5.4%), γ -muurolene (11.7%), γ -curcumene (5.7%), γ -cadinene (18.4%), 3-acetoxymorpha-4,7(11)-dien-8-one (7.4%)	Antifungal (<i>Macrophomina phaseolina</i> , EC ₅₀ 0.076 μ L/mL; <i>Rhizoctonia solani</i> , EC ₅₀ 0.094 μ L/mL; <i>Fusarium oxysporum</i> , EC ₅₀ 0.120 μ L/mL)	[50]
<i>E. amygdalinum</i> (aerial parts)	Amapá, Brazil	β -cubebene (5.7%), β -caryophyllene (12.3%), germacrene D (15.5%), δ -cadinene (5.8%), caryophyllene oxide (17.4%)	none reported	[51]
<i>E. argentinum</i> (leaves)	Córdoba, Argentina	α -pinene (17.0%), β -pinene (6.1%), <i>p</i> -cymene (12.5%), thymyl acetate (9.7%), β -caryophyllene (7.2%)	none reported	[52]
<i>E. arnottianum</i> (aerial parts)	Córdoba, Argentina	α -pinene (13.7%), <i>p</i> -cymene (30.0%), β -ocimene (5.3%), thymyl acetate (12.3%), β -caryophyllene (11.7%)	none reported	[53]
<i>E. arnottianum</i> (aerial parts)	Córdoba, Argentina	limonene (32.7%), piperitenone (21.2%), <i>trans</i> -dihydrocarvone (10.2%), camphor (6.8%), <i>cis</i> -dihydrocarvone (6.7%)	Antiviral (HSV-1, IC ₅₀ 52.1 μ g/mL; DENV-2, IC ₅₀ 38.2 μ g/mL)	[54]
<i>E. arnottii</i> (aerial parts)	San Luis, Argentina	β -caryophyllene (7.9%), γ -elemene (5.9%), germacrene D (9.8%), cadinene (5.8%), spathulenol (10.6%), phytol (8.1%)	Insecticidal (<i>Tribolium castaneum</i> , ED ₅₀ 0.15 mg/cm ²)	[55]
<i>E. ballotaefolium</i> (aerial parts)	Ceará, Brazil	α -pinene (6.2%), sabinene (6.5%), β -pinene (5.4%), myrcene (7.3%), limonene (15.3%), (<i>E</i>)- β -ocimene (10.5%), β -caryophyllene (7.5%)	none reported	[56]
<i>E. betonicaeforme</i> (leaves)	Ceará, Brazil	β -caryophyllene (36.1%), α -humulene (13.3%), γ -muurolene (20.3%), bicyclogermacrene (15.0%)	Larvicidal (<i>Aedes aegypti</i> , LC ₅₀ 129 μ g/mL)	[57]
<i>E. bunijifolium</i> (aerial parts)	Canelones, Uruguay	α -pinene (14.7%), β -elemene (12.2%), germacrene D (11.5%), trans- β -guaiene (6.5%)	none reported	[58]
<i>E. bunijifolium</i> (aerial parts)	San Luis, Argentina	α -pinene (51.0%), sabinene (7.5%), limonene (9.6%), β -caryophyllene (5.2%)	Insecticidal (<i>Tribolium castaneum</i> , ED ₅₀ 0.15 mg/cm ²)	[55]
<i>E. bunijifolium</i> (leaves)	Canelones, Uruguay	α -pinene (8.2%), germacrene D (11.1%), trans- β -guaiene (7.4%)	Varroacide (<i>Varroa destructor</i> , LD ₉₉ 0.3 mg/mL)	[59]
<i>E. cannabinum</i> ssp. <i>cannabinum</i> (aerial parts)	Agerola, Italy	δ -2-carene (6.5%), germacrene D (33.5%), α -farnesene (12.9%)	Antibacterial (<i>Staphylococcus aureus</i> , <i>Streptococcus fecalis</i> , <i>Bacillus subtilis</i> , <i>Bacillus cereus</i> , MIC 1.25 mg/mL)	[60]
<i>E. cannabinum</i> (leaves)	Tuscany, Italy	thymol methyl ether (7.8%), germacrene D (29.2%), spathulenol (7.3%)	none reported	[61]
<i>E. cannabinum</i> ssp. <i>corsicum</i> (aerial parts)	Corsica, France	α -phellandrene (19.0%), <i>p</i> -cymene (5.2%), germacrene D (28.5%)	none reported	[62]
<i>E. cannabinum</i> (aerial parts)	Mazandaran, Iran	α -terpinene (17.8%), thymol methyl ether (5.2%), germacrene D (9.1%)	none reported	[63]
<i>E. cannabinum</i> (leaves)	Vilnius, Lithuania	thymol methyl ether (5.7%), neryl acetate (9.4%), germacrene D (11.3%), β -bisabolene (6.7%)	none reported	[64]
<i>E. capillifolium</i> (aerial parts)	Cuba	<i>p</i> -cymene (23.7%), thymol methyl ether (8.9%), β -bisabolene (8.2%), selin-11-en-4 α -ol (12.3%)	none reported	[65]
<i>E. capillifolium</i> (aerial parts)	Mississippi, USA	myrcene (15.7%), α -phellandrene (6.5%), thymol methyl ether (36.3%), 2,5-dimethoxy- <i>p</i> -cymene (20.8%)	Insecticidal (<i>Stephanitis pyrioides</i> , LC ₅₀ 5800 μ g/mL)	[66]

<i>E. squalidum</i> (aerial parts)	Amapá, Brazil	β -caryophyllene (6.2%), germacrene D (21.6%), bicyclogermacrene (6.0%), spathulenol (14.2%), globulol (25.1%)	none reported	[51]
<i>E. squalidum</i> (aerial parts)	Tocantins, Brazil	limonene (6.6%), β -caryophyllene (9.6%), germacrene D (10.4%), caryophyllene oxide (30.1%)	none reported	[51]
<i>E. subhastatum</i> (leaves)	Córdoba, Argentina	α -pinene (11.0%), β -pinene (5.9%), <i>p</i> -cymene (24.8%), α -copaene (5.1%), α -humulene (5.1%)	none reported	[52]
<i>E. triplinerve</i> (leaves)	Lucknow, India	δ -elemene (5.9%), β -caryophyllene (14.7%), selina-4(15),7(11)-dien-8-one	none reported	[72]
<i>E. viscidum</i> (aerial parts)	San Luis, Argentina	6-methyl-5-hepten-2-one (18.2%), spathulenol (25.2%)	Insecticidal (<i>Tribolium castaneum</i> , ED ₅₀ > 0.212 mg/cm ²)	[55]

2.2. *Eurybia macrophylla* (L.) Cass.

Monoterpene hydrocarbons, limonene (28.66%), β -pinene (8.57%), and terpinolene (5.35%), and germacrane sesquiterpenes, germacrene D (19.81%), and germacrene B (7.07%), were the major components in the essential oil of *E. macrophylla* (Table 3). To our knowledge, there are no reports on essential oil compositions of any *Eurybia* species.

Table 3. Chemical composition of the essential oil of *Eurybia macrophylla* (L.) Cass.

2.3. *Eutrochium purpureum* (L.) E.E. Lamont (*syn. Eupatorium purpureum* L.)

The major components in the essential oil of *E. purpureum* were the green leaf volatiles (2E)-hexenal (60.59%) and hexanal (6.78%), along with the aromatic compounds eugenol (11.68%) and methyl salicylate (10.31%; Table 4). There have apparently been no previous reports on the essential oil composition of *E. purpureum* or any other *Eutrochium* species. There are numerous reports on *Eupatorium* essential oils, however (see above).

Table 4. Chemical composition of the essential oil of *Eutrochium purpureum* (L.) E.E. Lamont.

2.4. *Polymnia canadensis* L.

α -Phellandrene (28.30%), α -pinene (19.71%), and germacrene D (11.42%) were the major components in the essential oil from the aerial parts of *P. canadensis* (Table 5). The volatile chemical profile of *P. canadensis* in this current work is in marked contrast to our previous report on this species [45]. Previous samples were rich in the sesquiterpene hydrocarbons germacrene D (63.6% and 44.5%) and β -caryophyllene (15.9% and 14.8%). The differences in compositions are likely due to seasonal variation (the current sample was collected in July, 2018, while the previous samples were collected in September, 2015, and December, 2016, respectively). We cannot rule out, however, chemical profile differences attributable to environmental differences or biotic differences (e.g., genetics, herbivory, or pathogen stress).

Table 5. Chemical composition of the essential oil of *Polymnia canadensis* L.

2.5. *Rudbeckia laciniata* L.

Monoterpene hydrocarbons dominated the essential oil of *R. laciniata* (Table 6). The major components were limonene (58.07%), α -pinene (10.18%), β -pinene (9.21%), and myrcene (5.26%). While *R. laciniata* essential oil was rich in monoterpene hydrocarbons, the essential oils of *R. fulgida* and *R. hirta* were rich in sesquiterpene hydrocarbons [43]. The major components in *R. fulgida* essential oil were germacrene D (30.1%), δ -cadinene (17.8%), β -caryophyllene (10.0%), and γ -muurolene (8.9%), along with (E)- β -ocimene (6.2%) and (2E)-hexenal (6.0%). Similarly, the major components of *R. hirta* essential oil were germacrene D (23.6%), δ -cadinene (16.2%), β -caryophyllene (4.7%), γ -muurolene (8.1%), as well as (E)- β -ocimene (15.2%) and (2E)-hexenal (20.2%) [43]. The leaf essential oil of *Rudbeckia triloba*,

collected in Bucharest, Romania, was rich in monoterpene hydrocarbons, α -pinene (46.0%), sabinene (9.6%), and β -phellandrene (24.6%), along with germacrene D (6.1%), but devoid of limonene [73]. Thus, there do not seem to be any consistent chemical markers for the *Rudbeckia* genus.

Table 6. Chemical composition of the essential oil of *Rudbeckia laciniata* L.

2.6. *Silphium integrifolium* Michx.

The major components in the essential oil from the aerial parts of *S. integrifolium* were α -pinene (58.59%) and β -pinene (14.69%), followed by myrcene (9.70%; Table 7). Kowalski has extensively examined the essential oils of *S. integrifolium* as well as *S. trifoliatum* cultivated in Poland [74–78]. The leaf essential oil of *S. integrifolium* from Poland had α -pinene (7.3–9.8%), germacrene D (4.0–28.4%), *allo*-aromadendrene (3.7–8.5%), caryophyllene oxide (6.1–12.4%), and silphiperfol-6-en-5-one (3.7–5.1%) [74,75]; while the floral essential oil was made up of α -pinene (13.4–14.0%), camphene (5.3–5.7%), *trans*-verbenol (5.2–6.3%), bornyl acetate (6.5–7.0%), and *allo*-aromadendrene (5.6–6.1%) [74,77]. Thus, there are major qualitative and quantitative differences between the samples from Alabama and from Poland.

2.7. *Smallanthus uvedalia* (L.) Mack.

Monoterpene hydrocarbons dominated the essential oil of *S. uvedalia* (Table 8). α -Pinene (62.56%) was the major component, followed by limonene (11.43%) and β -pinene (6.00%). The chemical composition of this monoterpene-rich essential oil is very different from the compositions collected previously by us [45]. The previous samples, collected in February 2016, were dominated by β -caryophyllene (24.5% and 16.5%) and caryophyllene oxide (19.8% and 14.2%). The sample of *S. uvedalia* in this present work was collected in September 2018. The differences in composition may be due to seasonal variation, genetic differences, or environmental stresses. Nevertheless, α -pinene has dominated the essential oil compositions of other *Smallanthus* species. For example, α -pinene was the major component in the essential oil of *S. maculatus* from Costa Rica (32.9% α -pinene), which was also rich in camphene (5.4%),

β -pinene (7.1%), β -caryophyllene (10.7%), germacrene D (13.7%), and bicyclogermacrene (6.6%) [79]. Likewise, the essential oil of *S. quichensis* from Costa Rica was also dominated by α -pinene (35.5–64.5%) with lesser concentrations of α -phellandrene (0.1–9.0%), *p*-cymene (0.1–11.5%), limonene (2.1–5.8%), β -phellandrene (up to 9.2%), and 1,8-cineole (up to 9.7%) [80]. In contrast, *S. sonchifolia* essential oil, grown in Sichuan, China, was made up of β -phellandrene (26.3%), β -bourbonene (10.2%), β -caryophyllene (14.0%), and β -cubebene (17.6%) [81].

Table 7. Chemical composition of the essential oil of *Silphium integrifolium* Michx.

2.8. *Solidago altissima* L. (syn. *Solidago canadensis* L.)

The major components in the essential oil from the aerial parts of *S. altissima* (syn. *S. canadensis*) from Alabama were α -pinene (13.91%), sabinene (14.25%), myrcene (20.29%), bornyl acetate (14.44%), and germacrene D (10.67%; Table 9). Previous examinations of *S. canadensis* essential oils have shown germacrene D to be one of the most abundant components (Table 10). However, Weyerstahl and co-workers [82] found curhone (23.5%) to be a major component of *S. canadensis* from Poland, Schmidt and co-workers [83] found cyclocolorenone (38%) to be a major component in *S. canadensis* from northern Germany, and Kasali and co-workers [84] found 6-*epi*- β -cubebene to be a major component (20.5%) in *S. canadensis* essential oil from Poland. Interestingly, none of these compounds was detected in the sample of *S. altissima* essential oil from Alabama.

Table 9. Chemical composition of the essential oil of *Solidago altissima* L.

2.9. *Xanthium strumarium* L.

The major volatile components from the aerial parts of *X. strumarium* were limonene (48.23%), myrcene (14.31%), germacrene D (13.92%), (2E)-hexenal (5.79%), and sabinene (4.89%; Table 11). The compositions of *Xanthium strumarium* essential oils from the Middle East have been reported, including Iran [93,94] and Pakistan [95]. The leaf essential oil from Khorramabad, Iran, was composed largely of limonene (24.7%), borneol (10.6%), bornyl acetate (5.9%), and β -cubebene (6.3%) [93]. The leaf essential oil from Zabol, Iran, was qualitatively similar, limonene (20.3%), borneol (11.6%), bornyl acetate (4.5%), and β -cubebene (3.8%), but also contained a large concentration of *cis*- β -guaiene (34.2%), which was not observed in any other *X. strumarium* essential oils [94]. The leaf essential oil of *X. strumarium* from Lahore, Pakistan, contained limonene (5.7%), β -caryophyllene (17.5%), spathulenol (6.1%), and α -cadinol (6.7%) as major components [95]. The differences in chemical compositions may be related to different genetic factors as well as geographical location; Tropicos® currently lists 13 subordinate taxa for *X. strumarium* [14].

2.10. Antifungal Screening

Depending on material available, the essential oils were screened for antifungal activity against the opportunistic fungal pathogens *Aspergillus niger*, *Candida albicans*, and *Cryptococcus neoformans* using the microbroth dilution technique (Table 12). The essential oil of *E. serotinum* showed promising antifungal activity against *C. neoformans* with a minimum inhibitory concentration (MIC) value of 78 μ g/mL. The high concentration of cyclocolorenone in *E. serotinum* is likely responsible for the observed antifungal activity of this essential oil. Cyclocolorenone had been previously reported to show antifungal activity against *Curvularia lunata*, *Chaetomium cochliodes*, and *Chaetomium spinosum* [96]. Germacrene D may also contribute to the antifungal activity of *E. serotinum* essential oil as well as essential oils of *E. macrophylla*, *P. canadensis*, and *R. laciniata*. Germacrene D has shown antifungal activity against *Aspergillus niger* with MIC of 39 μ g/mL [97].

Table 12. Major components and antifungal activities of Asteraceae essential oils.

Plant Species	Major Components (>5%) in the Essential Oil	Antifungal Activity, MIC, µg/mL ^a		
		<i>Aspergillus niger</i>	<i>Candida albicans</i>	<i>Cryptococcus neoformans</i>
<i>Eupatorium serotinum</i> Michx.	germacrene D (6.6%), palustrol (5.4%), cyclocolorenone (23.5%)	313	625	78
<i>Eurybia macrophylla</i> (L.) Cass.	β-pinene (8.5%), limonene (28.6%), terpinolene (5.3%), germacrene D (19.7%), germacrene B (7.0%)	625	625	156

^a Each minimum inhibitory concentration (MIC) determination was carried out in triplicate. ^b n.t. = not tested due to limited availability of the essential oil.

The modest antifungal activity of *E. purpureum* is somewhat surprising. The major components were hexanal, (2E)-hexenal, methyl salicylate, and eugenol. Hexanal [98] and (2E)-hexenal [99,100] are both known to be antifungal to plant pathogenic fungi. Methyl salicylate is only weakly antifungal against *A. niger*, *C. albicans*, or *C. neoformans*, but eugenol is somewhat active (see Table 13). Monoterpene hydrocarbons such as α-pinene, β-pinene, limonene, or myrcene show only weak antifungal activity (Table 13) and are not expected to contribute to the antifungal activities of the essential oils unless there are synergistic effects of these components (see, for example [101,102]). The mechanisms of antifungal activity of essential oils are poorly understood. However, it has been suggested that essential oils and their components, being lipophilic, can disrupt the membranes of fungi causing membrane permeability [103].

Table 13. Antifungal activities (MIC, µg/mL) of essential oil components.

Compound	<i>Aspergillus niger</i>	<i>Candida albicans</i>	<i>Cryptococcus neoformans</i>
α-Pinene	1250	625	313
β-Pinene	625	1250	625
Limonene	625	1250	625
Myrcene	625	625	625
Methyl salicylate	625	625	625
Eugenol	78	313	156
Bornyl acetate	625	625	625

3. Materials and Methods

3.1. Plant Material

Aerial parts of each plant were collected from various sites in north Alabama (Table 14). Plants were identified by S.K. Lawson and voucher specimens were deposited in the University of Alabama in Huntsville herbarium (HALA). The fresh plant material (aerial parts) were chopped and hydrodistilled using a Likens–Nickerson apparatus with continuous extraction with CH₂Cl₂ for three hours. The solvent was evaporated to give pale yellow essential oils (Table 14).

Table 14. Plant collection sites and essential oil yields of Asteraceae from north Alabama.

Plant	Collection Site, Date	Voucher Number	Mass of Aerial Parts (g)	Yield of Essential Oil (mg)
<i>Eupatorium serotinum</i> Michx.	34°38'29" N, 86°24'39" W, elev. 199 m 13 September 2018	233754	49.09	6.4 (0.013%)
<i>Eurybia macrophylla</i> (L.) Cass.	34°39'25" N, 86°24'45" W, elev. 241 m 15 September 2018	233117	56.56	10.6 (0.019%)
<i>Eutrochium purpureum</i> (L.) E.E. Lamont	34°38'40" N, 86°27'22" W, elev. 180 m 12 August 2018	091843	63.44	12.3 (0.019%)
<i>Polymnia canadensis</i> L.	34°38'29" N, 86°24'39" W, elev. 199 m 21 July 2018	184700	52.89	39.1 (0.074%)
<i>Rudbeckia laciniata</i> L.	34°42'42" N, 86°32'38" W, elev. 345 m 13 September 2018	004426	54.53	6.0 (0.011%)
<i>Silphium integrifolium</i> Michx.	34°42'42" N, 86°32'38" W, elev. 345 m 15 September 2018	004152	15.02	6.4 (0.043%)
<i>Smallanthus uvedalia</i> (L.) Mack.	34°42'42" N, 86°32'38" W, elev. 345 m 15 September 2018	000714	56.21	5.9 (0.010%)
<i>Solidago altissima</i> L.	34°38'40" N, 86°27'22" W, elev. 180 m 12 August 2018	001425	54.41	44.9 (0.083%)
<i>Xanthium strumarium</i> L.	34°38'49" N, 86°24'38" W, elev. 200 m 15 September 2018	224724	69.69	7.0 (0.010%)

3.2. Gas Chromatography–Mass Spectrometry

The Asteraceae essential oils were analyzed by GC–MS using a Shimadzu GC–MS-QP2010 Ultra fitted with a Phenomenex ZB-5ms column as previously described [104]. Identification of the essential oil components was determined by comparison of their retention indices, determined with respect to a homologous series of *n*-alkanes and their mass spectral fragmentation patterns with those from available databases (Adams [105], NIST17 [106], and FFNSC 3 [107]) or in our in-house library [108].

3.3. Gas Chromatography–Flame Ionization Detection

Quantification of the essential oils was determined by GC–FID using a Shimadzu GC 2010 instrument fitted with a ZB-5 column [104], using the same parameters that were used for the GC–MS. The concentrations (average of three measurements \pm standard deviations) are based on peak integration without standardization.

3.4. Antifungal Screening

The essential oils were screened for antifungal activity against *Aspergillus niger* (ATCC 16888), *Candida albicans* (ATCC 18804), and *Cryptococcus neoformans* (ATCC 24607) using the microbroth dilution method as previously described [109]. Amphotericin B was used as the positive control and RPMI medium was used as the negative control. The antifungal assays were carried out in triplicate.

4. Conclusions

There is much intraspecific variation in essential oil compositions of these members of the Asteraceae. Much of the variation can be attributed to geographical location or seasonal variation.

Eupatorium serotinum essential oil showed notable antifungal activity against *Cryptococcus neoformans*. However, the yield of this essential oil (0.013%) is too low to be considered as pharmacologically useful. If suitable sources of the major component cyclocolorenone can be identified, then this compound may serve as important antifungal template for further elaboration.

Author Contributions: Conceptualization, S.K.L. and W.N.S.; methodology, W.N.S., R.L.M., and P.S.; software, P.S.; validation, W.N.S.; formal analysis, W.N.S.; investigation, S.K.L., L.G.S., C.N.P., and P.S.; resources, R.L.M., P.S., and W.N.S.; data curation, W.N.S.; writing—original draft preparation, W.N.S.; writing—review and editing, S.K.L., L.G.S., C.N.P., R.L.M., P.S., and W.N.S.; supervision, W.N.S. and R.L.M.; project administration, W.N.S. All authors have read and agreed to the published version of the manuscript.

Funding: This research received no external funding.

Acknowledgments: P.S. and W.N.S. participated in the project as part of the activities of the Aromatic Plant Research Center (APRC, <https://aromaticplant.org/>).

Conflicts of Interest: The authors declare no conflict of interest.
