

Suppl. Fig. S2. VSIR prognostic value in FLT3-ITD subgroups. (A) Patients are significantly stratified by their VSIR expression if they are FLT3-ITD WT, but not if they are FLT3-ITD mutant. (B) Given that a patient has the NPM1 mutation, those with the FLT3-ITD mutation have lower VSIR expression. (C-D) For patients with the NPM1 mutation, VSIR expression does not significantly stratify patients within the FLT3-ITD mutant or FLT3-ITD WT subgroups.
