In the title compound, $C_{26}H_{28}N_5O_2^+\cdot Cl^- \cdot CH_3OH$ [systematic name: 4-(2-carbamoyl-1-benzofuran-5-yl)-1-[4-(5-cyano-1*H*-indol-3-yl)butyl]piperazin-1-ium chloride methanol monosolvate], the protonated piperazine ring adopts a chair conformation. The indole ring plane is nearly perpendicular to the benzofuran ring system, with a dihedral angle of $85.77(2)^\circ$. In the crystal, the organic cations, Cl^- anions and methanol solvent molecules are linked by classical N—H···O and N—H···Cl hydrogen bonds, and weak C—H···O and C—H···π interactions into a three-dimensional supramolecular architecture.

1. Chemical context

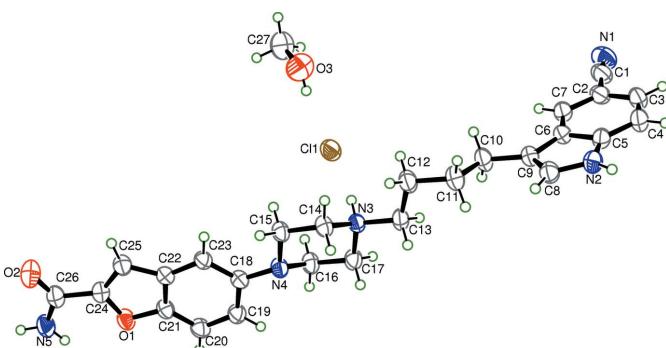

Major depression disorder (MDD) currently ranks as the world's fourth greatest cause of illness and is expected to rank second by the year 2020 according to WHO studies (Murray & Lopez, 1996). The title compound, viladotone hydrochloride (marketed as Viibryd by Forest Pharmaceuticals), is a new treatment option for MDD. It was approved on January 21, 2011 by the FDA, licensed by Merck KGaA.

Vilazodone hydrochloride is a selective serotonin re-uptake inhibitor (SSRI) with properties that are most similar to those of citalopram, escitalopram (levapro), fluoxetine, proxetine, and sertraline. The new drug differs from its predecessors by also acting as a partial agonist at serotonergic 5-HT_{1A} receptors. The mechanism of the antidepressant effect of vilazodone is thought to be related to its enhancement of serotonergic activity in the CNS through selective inhibition of serotonin re-uptake. Vilazodone binds with high affinity to the serotonin re-uptake site but not to the norepinephrine or dopamine re-uptake site. As a result, vilazodone potently and selectively inhibits the re-uptake of serotonin (Choi *et al.*, 2012; Reed *et al.*, 2012; Schwartz & Singh, 2012). Many patents and papers have been reported on the synthesis, polymorphism and bioavailability of this drug (Bathe *et al.*, 2011; Heinrich & Böttcher, 2004; Leksic *et al.*, 2013; Lu *et al.*, 2012) but up till now, its three-dimensional structure has not been reported. This work concerns the crystal structure of vilazodone hydrochloride methanol solvate, (I), studied at 275 K.

OPEN ACCESS

**Figure 1**

The molecular structure of the title compound, showing the atom-labelling scheme and displacement ellipsoids at 40% probability level. H atoms are shown as small circles of arbitrary radii.

2. Structural commentary

The title compound combines indole-butyl-amine and chromenonyl piperazine structural elements in a single molecular entity. The asymmetric unit of (I) contains one protonated vilazodone cation, one Cl^- anion and one methanol molecule (Fig. 1).

The expected proton transfer from hydrochloric acid to atom N3 of piperazine occurs; the H atom on the piperazine N3 atom was located unequivocally in the electron-density map. The six-membered piperazine ring adopts a chair conformation. The electron-withdrawing cyano group at position 5 on the indole is twisted out of the mean plane of the indole unit, as indicated by the relevant torsion angles N1—C1—C2—C7 and N1—C1—C2—C3 [144.3 (2) and 34.0 (2) $^\circ$, respectively]. The conformation of the cyano group is similar

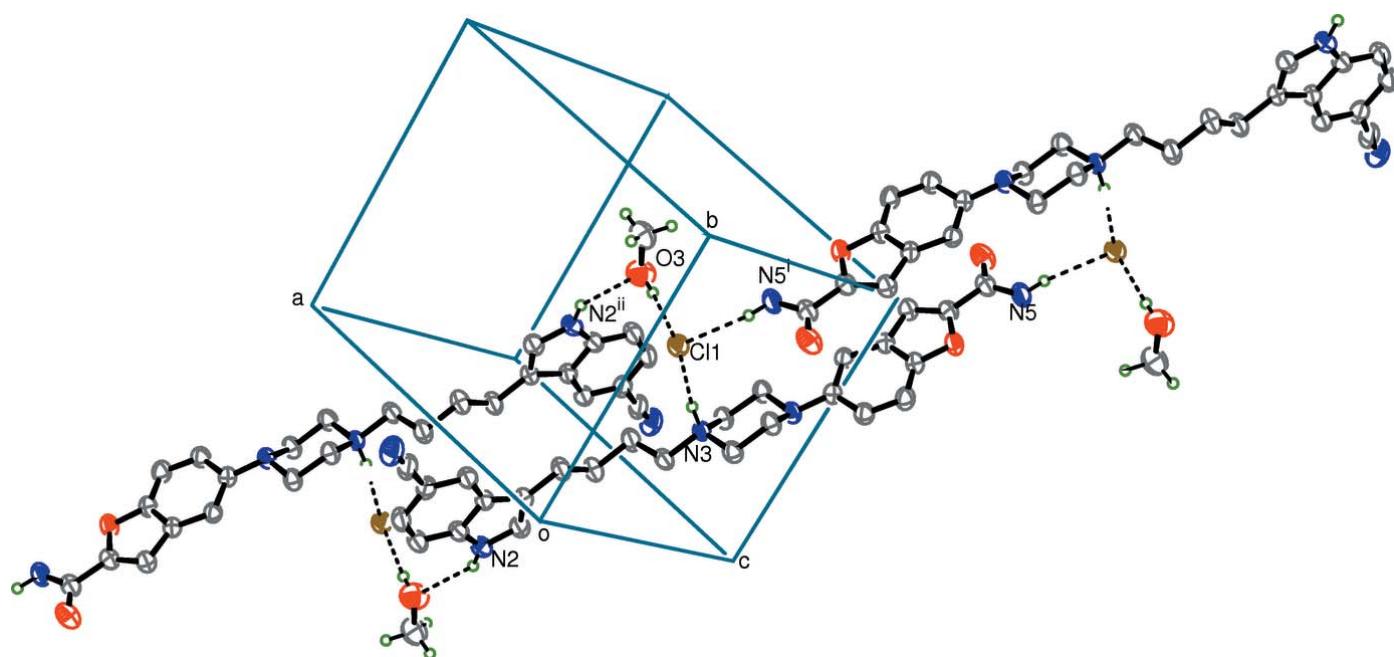

Table 1
Hydrogen-bond geometry (\AA , $^\circ$).

$Cg5$ is the centroid of the C18—C22 ring.

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
N2—H2 \cdots O3 ⁱ	0.86	2.25	2.971 (3)	141
N3—H3A \cdots Cl1	0.91	2.18	3.0787 (19)	172
N5—H5A \cdots Cl1 ⁱⁱ	0.86	2.42	3.250 (2)	162
N5—H5B \cdots N1 ⁱⁱⁱ	0.86	2.33	3.151 (4)	160
O3—H3B \cdots Cl1	0.82	2.38	3.195 (2)	171

C19—H19 \cdots O3 ^v	0.93	2.55	3.348 (3)	144
C14—H14B \cdots Cg5 ^{vi}	0.97	2.48	3.393 (2)	156

Symmetry codes: (i) $-x+1, -y, -z+1$; (ii) $-x, -y+2, -z+2$; (iii) $-x, -y+1, -z+1$; (iv) $x, y-1, z-1$; (v) $x-1, y, z$; (vi) $-x, -y+1, -z+2$.

to that of other drugs containing nitrile groups, such as bicalutamide and Febuxostat (Hu & Gu, 2005; Jiang *et al.*, 2011). The indole moiety is connected by an *n*-butyl linker to the piperazine ring. The conformation of the butyl chain is of some interest. Three C atoms of the butyl group (C10, C11 and C12) are coplanar with atom C9 of the indole, as confirmed by the C9—C10—C11—C12 torsion angle of 179.2 (2) $^\circ$, meanwhile atoms C11, C12 and C13 are coplanar with piperazine atom N3. A dihedral angle of 80.9 (2) $^\circ$ is formed between the mean planes of N3/C11—C13 and C9—C12. The dihedral angle between the C9—C12 mean plane and the indole plane is 10.0 (2) $^\circ$. The second piperazine N atom, N4, is bonded to the benzofuran ring. The formamide group is almost coplanar with the connected benzofuran ring, making a dihedral angle of 2.53 (2) $^\circ$. The indole ring is almost perpendicular to the benzofuran ring, as indicated by the dihedral angle of 85.77 (2) $^\circ$ between them.

**Figure 2**

Part of the crystal packing of the title compound. Hydrogen bonds are shown as dashed lines. H atoms not involved in hydrogen bonding have been omitted for clarity.

3. Supramolecular features

In the crystal, N3—H3A···Cl1, O3—H3B···Cl1 and N2—H2···O3ⁱ [symmetry code: (i) 1 - x , - y , 1 - z] hydrogen bonds (Table 1), connect the Cl⁻ ion to two neighbouring cations and a methanol molecule, forming a molecular dimer. Hydrogen bonds N5—H5A···Cl1ⁱⁱ [symmetry code: (ii) 1 - x , 2 - y , 2 - z] and N3—H3A···Cl1 link another two neighbouring cations and the Cl⁻ anion into a molecular sheet. As a result, 28-membered rings with the graph-set motif $R_4^4(28)$ are generated (Fig. 2).

4. Synthesis and crystallization

Vilazodone hydrochloride was supplied by Hangzhou HEZE pharmaceutical Technology Co., Ltd. It was recrystallized from methanol solution, giving single crystals suitable for X-ray diffraction.

5. Refinement

Experimental details including the crystal data, data collection and refinement are summarized in Table 2. The difference density indicated the presence of an H atom at atom N3, showing proton transfer from HCl to the amino group of the vilazodone ring. This H atom was placed in a calculated position with N—H = 0.91 Å and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$. All other H atoms were placed in calculated positions with O—H = 0.82, N—H = 0.86 and C—H = 0.93–0.98 Å, and included in the refinement in a riding model with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}$ (carrier atom).

Extinction coefficient: 0.096 (6)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.
