The title compound, $[Cu_2(C_9H_7O_4)_4(C_3H_7NO)_2] \cdot 2C_3H_7NO$, crystallizes in the monoclinic $P2_1/c$ space group, with the binuclear copper unit occupying a special position on an inversion center, *i.e.* the asymmetric unit of the crystal consists of one Cu^{II} ion, two 2-(methoxycarbonyl)benzoate ligands, and two DMF molecules (one coordinated and one solvate). The binuclear complex displays a paddle-wheel-shaped structure with the two copper atoms being in a Jahn-Teller-distorted octahedral coordination environment. Each 2-(methoxycarbonyl)benzoate substituent acts as a bridging ligand and links two Cu atoms with a Cu–Cu distance of 2.633 (1) Å. The carboxylate groups of the 2-(methoxycarbonyl)benzoate ligands adopt bidentate *syn-syn* bridging modes, with dihedral angles between the carboxylate planes and the aromatic rings of 18.427 (4) and 43.029 (6)°. In the crystal, adjacent DMF molecules coordinated to copper atoms are arranged in a mutual 'head-to-tail' manner by offset face-to-face π – π stacking interactions, resulting in chains along the *c*-axis direction. The planes of the coordinated DMF molecules are parallel to each other, the distance between them being 3.33 (1) Å. A three-dimensional structure is assembled from the chains by weak C–H···O and C–H··· π intermolecular interactions involving the DMF solvent molecules. One of the methyl ester groups is disordered over two sites with an occupancy ratio of 0.751 (12):0.249 (12).

1. Chemical context

Binuclear Cu^{II} compounds have been an attractive target for chemical research because of their wide range of applications in materials chemistry (Kato *et al.*, 1964; Farraj *et al.*, 2017), environmental (Pokharel *et al.*, 2014) and biological chemistry (Ma & Moulton, 2007). In crystal engineering, the carboxylate ligands are widely used as linkers in the design of binuclear complexes as they exhibit versatile coordination modes for bonding of different metal ions, including monodentate – chelating and monoatomic bridging, as well as bridging modes in *syn-anti*, *anti-anti* and *syn-syn* conformations (Su *et al.*, 2015). Thus, carboxylate ligands can adopt μ_2 -*O*, chelate or bridging modes to construct binuclear copper complexes. In addition, the Cu–Cu dimer can be tetra bridged by four carboxylate groups to form a paddle-wheel building unit. Furthermore, the paddle-wheel building unit may be axially coordinated by means of two monodentate ligands to give the formula $[Cu_2(OOCR)_4L_2]$ (Suh *et al.*, 2012). For example, $[Cu_2(aspirinate)_4L_2]$ [$L = N,N$ -dimethylformamide (DMF), 3-

**OPEN ACCESS**

bromopyridine, quinoline, pyridine; Ma & Moulton, 2007], $[\text{Cu}_2(\text{Sal})_4(\text{acetonitrile})_2]$ (Sal = salicylate; Liu *et al.*, 2017), $[\text{Cu}_2[2-(\text{methoxycarbonyl})\text{benzoate}]_4(\text{MeOH})(\text{DMF})]$, (Liu *et al.*, 2008), $[\text{Cu}_2(2-(\text{methoxycarbonyl})\text{benzoate})_4(\text{acetonitrile})_2]$ (Wang *et al.*, 2013). In a similar way, binuclear copper coordination polymers (CPs) with paddle-wheel cluster units can be coordinated by functional ligands in the axial position, including 4,4'-bipyridine (Liu *et al.*, 2005), pyrazine (Kitao *et al.*, 2017), 2,5-bis(4-pyridyl)-1,3,4-oxadiazole (Hou *et al.*, 2004), forming a class of multifunctional polymer materials. Moreover, it is well known that the solubility and lipophilicity are the key parameters of drugs, and the appropriate choice of an axial ligand affords the ability to significantly alter these properties.

In this paper, we report the synthesis and crystal structure of a new binuclear copper complex $[\text{Cu}_2(2-(\text{methoxycarbonyl})\text{benzoate})_4(\text{DMF})_2]$, (I), containing the paddle-wheel building unit.

2. Structural commentary

The title compound crystallizes in the monoclinic $P2_1/c$ space group, with the binuclear copper unit occupying a special position on the inversion center. The asymmetric unit consists of one Cu^{II} ion, two 2-(methoxycarbonyl)benzoate ligands, and two DMF molecules (one coordinated and one solvate). The complex displays a paddle-wheel-shaped binuclear structure (Fig. 1). If the $\text{Cu}-\text{Cu}$ bonding contact is neglected, each Cu^{II} ion is pentacoordinated to four carboxylate oxygen atoms [O_1 , O_2^i , O_5 and O_6^i] of four 2-(methoxycarbonyl)benzoate ligands and one oxygen atom [O_9] from the DMF molecule. Both Cu^{II} ions exhibit Jahn–Teller square-pyramidal geometries ($\tau = 0$), with four short $\text{Cu}-\text{O}(\text{carboxylate})$ [1.934 (4) to 1.968 (4) Å; Table 1] bond lengths in the equatorial plane and one long $\text{Cu}-\text{O}(\text{DMF})$ [2.132 (4) Å] bond length at the axial position. Each 2-(methoxycarbon-

Table 1
Selected geometric parameters (Å, °).

$\text{Cu}_1-\text{Cu}_1^i$	2.6329 (14)	Cu_1-O_5	1.968 (4)
Cu_1-O_1	1.943 (4)	Cu_1-O_6^i	1.953 (4)
Cu_1-O_2^i	1.934 (4)	Cu_1-O_9	2.132 (4)
$\text{O}_2^i-\text{Cu}_1-\text{O}_1$	168.03 (18)	$\text{O}_6^i-\text{Cu}_1-\text{O}_5$	168.06 (18)
$\text{O}_2^i-\text{Cu}_1-\text{O}_6^i$	90.25 (19)	$\text{O}_2^i-\text{Cu}_1-\text{O}_9$	99.14 (18)
$\text{O}_1-\text{Cu}_1-\text{O}_6^i$	89.05 (19)	$\text{O}_1-\text{Cu}_1-\text{O}_9$	92.82 (18)
$\text{O}_2^i-\text{Cu}_1-\text{O}_5$	88.7 (2)	$\text{O}_6^i-\text{Cu}_1-\text{O}_9$	96.36 (17)
$\text{O}_1-\text{Cu}_1-\text{O}_5$	89.48 (19)	$\text{O}_5-\text{Cu}_1-\text{O}_9$	95.55 (17)

Symmetry code: (i) $-x + 1, -y + 1, -z + 1$.

yl)benzoate substituent acts as a bridging ligand and links two Cu atoms with a $\text{Cu}-\text{Cu}(-x + 1, -y + 1, -z + 1)$ distance of 2.633 (1) Å; this is close to the 2.64 Å reported for the similar dinuclear complex $[\text{Cu}_2(\text{OAc})_4 \cdot 2\text{H}_2\text{O}]$ (Kato *et al.*, 1964). However, the $\text{Cu}-\text{Cu}^i$ distance in (I) is slightly longer than the $\text{Cu}-\text{Cu}$ separation of 2.56 Å in metallic copper (Jones *et al.*, 1997). The carboxylate groups of the 2-(methoxycarbonyl)benzoate ligands adopt bidentate *syn-syn* bridging modes, with the dihedral angles between the carboxylate planes and the aromatic rings of 18.427 (4) and 43.029 (6)°.

3. Supramolecular features

The crystal structure of (I) contains both coordinated and solvate DMF molecules. As illustrated in Fig. 2, adjacent DMF molecules coordinated to copper atoms are arranged in a mutual ‘head-to-tail’ manner by offset face-to-face $\pi-\pi$ stacking interactions (Wang *et al.*, 2010), resulting in chains along the *c*-axis direction. The planes of the coordinated DMF molecules are parallel to each other, the distance between them being 3.33 (1) Å. The three-dimensional structure of (I) is assembled from these chains by further weak C–H···O interactions ($\text{H}\cdots\text{A}$ distances of 2.63–2.70 Å; Table 2) and intermolecular $\pi\cdots\pi$ interactions (Fig. 3).

C23—H23A \cdots O6 ⁱⁱ	0.96	2.70	3.538 (11)	145
C3—H3 \cdots O10 ⁱⁱⁱ	0.93	2.63	3.284 (10)	128
C6—H6 \cdots O10 ^{iv}	0.93	2.69	3.355 (11)	129

Symmetry codes: (i) $-x + 1, -y + 1, -z + 1$; (ii) $x, -y + \frac{3}{2}, z + \frac{1}{2}$; (iii) $-x, y - \frac{1}{2}, -z + \frac{1}{2}$; (iv) $-x, -y + 1, -z + 1$.

4. Database survey

There are a number of Cu paddle-wheel structures $[\text{Cu}_2(\text{OOCR})_4L_2]$ in the crystallographic literature with benzene carboxylates derivatives (Cambridge Structural Database, Version 5.39, updated in November 2017; Groom *et al.*, 2016). In most cases, both copper centers in these complexes feature a coordinated water molecule in the axial position, which can be replaced by small solvent molecules to generate potential binding sites; for example, $L = \text{Cl}^-$ (Silva *et al.*, 2001), urea, ethanol, benzoic acid (Kato *et al.*, 1964), *N,N*-dimethylformamide, 3-bromopyridine, quinoline, pyridine, isonicotinamide, nicotinamide, 3-phenylpyridine (Ma & Moulton, 2007), acetonitrile (Liu *et al.*, 2017, Wang *et al.*, 2013), methanol (Liu *et al.*, 2008), 2-picoline (Del Sesto *et al.*, 2000). Various polycarboxylic benzene derivatives have been synthesized to obtain porous coordination polymers (Guillerm *et al.*, 2014), which exhibit different properties owing to different substituent groups in the axial sites.

5. Synthesis and crystallization

The title complex was synthesized according to a literature procedure (Wang *et al.*, 2013). 2-(Methoxycarbonyl)benzoic acid (180.0 mg, 1.0 mmol) and NaOH (40.0 mg, 1.0 mmol) were dissolved in a methanol solution (20 mL) while stirring at room temperature for 20 min. Then, 15 mL of a methanol solution containing $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ (121 mg, 0.5 mmol) was added to the mixture, and the mixture was further stirred at room temperature for 90 min. The blue precipitate obtained was separated by filtration, washed with methanol and dried.

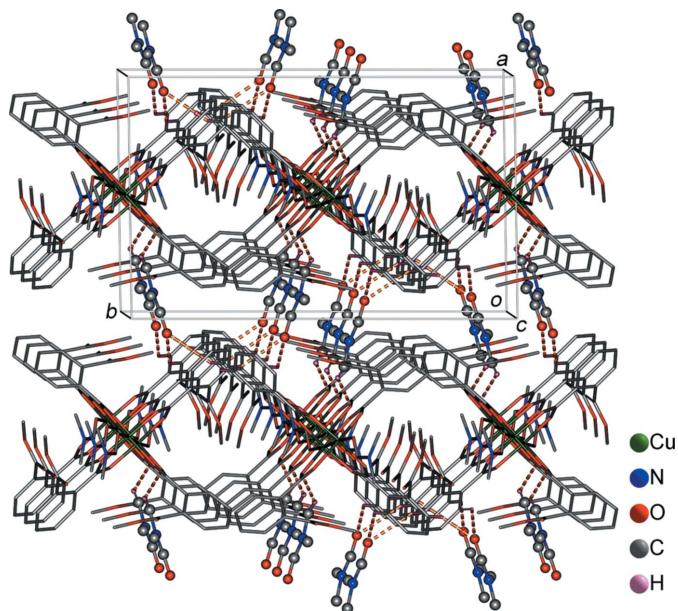

Figure 3

The crystal packing of (I) showing the three-dimensional supramolecular network along the c axis. The intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds are shown as yellow dotted lines.

The powder was dissolved in *N,N*-dimethylformamide, and blue single crystals were collected after slow evaporation at room temperature for several weeks.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All hydrogen atoms were positioned geometrically with $\text{C}-\text{H} = 0.93\text{--}0.96 \text{\AA}$ and refined using the riding model with fixed displacement parameters [$U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl groups and $1.2U_{\text{eq}}(\text{C})$ for the other groups]. One of the methyl ester groups is disordered over two sets of sites with an occupancy ratio of 0.751 (12):0.249 (12). The displacement parameters of the O4/O4A and C9/C9A atoms of the disordered fragment were restrained to be similar (Sheldrick, 2015).

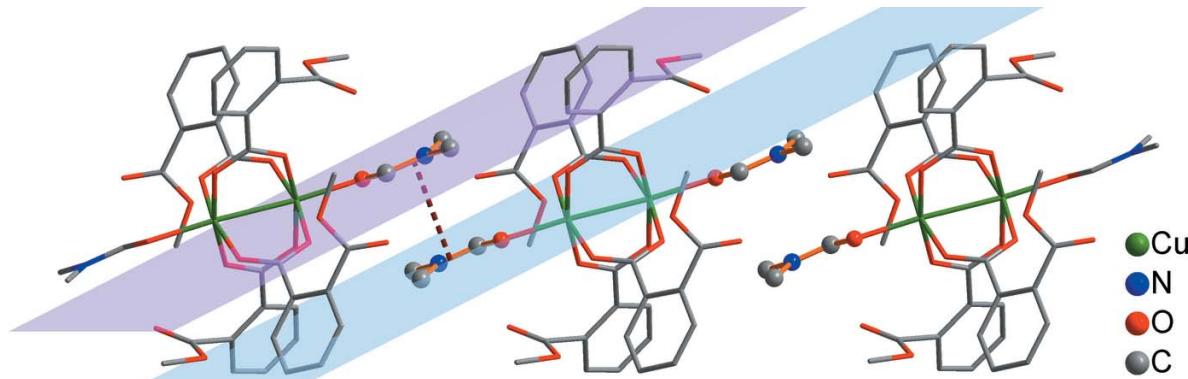

Figure 2

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
