Received 11 July 2012; accepted 18 July 2012

Key indicators: single-crystal X-ray study; T = 298 K; mean σ (C–C) = 0.005 Å; R factor = 0.037; wR factor = 0.110; data-to-parameter ratio = 12.9.

In the title compound, $[Co(C_8H_6N_3)_2(C_2H_8N_2)]NO_3 \cdot H_2O$, the Co^{III} ion is coordinated by four N atoms from two 2-(pyridin-2-yl)-1,3-imidazol-1-ide ligands and two N atoms of ethylenediamine in a distorted octahedral geometry. In the crystal, classical N-H···N(O) and O-H···N(O) hydrogen bonds connect all the isolated components together to yield a three-dimensional structure.

(Ethylenediamine- $\kappa^2 N$, N)bis[2-(pyridin-2-yl- κN)-1,3-imidazol-1-ido- κN^1]cobalt(III) nitrate monohydrate

Xiu-Ling Feng and Yu-Ping Zhang

Comment

Organometallic complexes with the 2-(2-pyridyl)imidazole ligand (Dosser & Underhill, 1972; Lan *et al.*, 2008) are intensively studied due to their magnetic properties (Carranza *et al.*, 2009; Schott *et al.*, 2011). Herewith we report the crystal structure of the title compound, (I) - a Co(III) complex with 2-(2-pyridyl)imidazolato ligands.

In (I) (Fig. 1), Co(III) ion is chelated by one ethylenediamine and two 2-(2-pyridyl)imidazolato ligands being coordinated by six N atoms in a distorted octahedral geometry. The bite angles of ethylenediamine and 2-(2-pyridyl)-imidazolato chelate ligands to the cobalt atom are *ca* 84.72 (11)° and 89.02 (11)°, respectively. An extensive hydrogenbonding network (Table 1) involving the N atoms of the ethylenediamine and 2-(2-pyridyl)imidazolato ligands, the water molecule and O atoms of nitrate anion interconnect all the isolated moieties together to yield a three-dimensional structure (Fig. 2).

Experimental

An ethanol solution (7 ml) of 2-(2-pyridyl)imidazole (0.5 mmol) was slowly added to an aqueous solution (8 ml) of $Co(NO_3)_2.6H_2O$ (0.5 mmol) and ethylenediamine (2 mmol). Red block crystals were obtained after two months.

Refinement

All H atoms were geometrically positioned (C—H = 0.93–0.97 Å; O—H = 0.85 Å; N—H = 0.90 Å) and treated as riding, with $U_{iso}(H) = 1.2U_{eq}$ of the parent atom.

direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
