ABSTRACT

BACKGROUND: With the emergence of the WHO Framework Convention on Tobacco Control, globally the use of tobacco has decreased notably, although, it still requires efforts at individual, organizational, community level to decrease the rate further. Dental professionals are at an excellent position to provide tobacco cessation counselling and interventions, however, it is not practiced much due to lack of training and lack of knowledge. Therefore, this systematic review was conducted to assess the global status of knowledge, attitude and practice on tobacco cessation interventions among dental professionals.

MATERIALS AND METHOD: A systematic search of 6 databases with no language restriction since 2000 was undertaken. Studies were included if they assessed knowledge, attitude and practice on tobacco cessation interventions among dental professionals using a validated or prevalidated tool. The data obtained for assessment of knowledge, attitude, practice, curriculum and barriers were represented through heatmaps. Quality assessment of the studies was done using Newcastle Ottawa scale.

RESULTS: Fifty six studies were included in this systematic review. Majority of the studies were found to be of moderate quality. Knowledge regarding the tobacco cessation interventions was more theoretical than practical. All the studies showed a favorable attitude among dental professionals towards tobacco cessation intervention.

CONCLUSION: The included studies lack homogeneity in assessing knowledge, attitude and practice on tobacco cessation interventions. The development and validation of a standardized questionnaire to assess knowledge, attitude and practice on tobacco cessation interventions could be a potentially effective way to uniformly gather data on the subject.

KEYWORDS: oral cancer, smoking, smokeless tobacco, tobacco counselling, nicotine replacement therapy, dental professionals

Introduction

The history of tobacco counseling dates back to the 1970s when the recommendations to dentists to help patients to quit smoking were initiated by the air force dental clinic at Lackland, USA.¹ Tobacco cessation counseling is a practice used by health professionals to train patients on how to quit tobacco use in any form. According to the World Health Organization, tobacco

cessation should be a part of dental practice where dental and non dental professionals should be actively involved in helping patients to quit tobacco.^{2,3}

Dental care professionals are in a better position and therefore play a potential role to identify tobacco users, as during a routine check up intraoral signs such as halitosis, tobacco stains and oral hygiene problems can be examined.⁴ Combating

the tobacco epidemic should be done through regular tobacco cessation intervention in their everyday clinical practice. However, globally studies have reported that the proportion of tobacco users who receive guidance and counseling from a dental professional is not sufficient.^{5,6}

A comprehensive and integrated tobacco control programme must incorporate both the promotion of quitting smoking as well as the treatment of tobacco dependency. The healthcare professionals can support the smokers in their efforts to stop using tobacco and helping them to overcome their addiction may strengthen other tobacco control strategies as well, which is in fact in line with the WHO FCTC article 14.⁷

Even though the consumption of tobacco has decreased globally by 22.3%, further efforts at tobacco control are required by the community, healthcare professionals and through changes in policy in order to see more decline in the trend of tobacco consumption.⁸

Healthcare professionals must be informed of behavioral as well as pharmacotherapy related measures for tobacco cessation.⁹ Previous systematic reviews have been conducted which have assessed either attitude¹⁰ or practice^{11,12} among different healthcare workforce such as nurses,¹¹ dental professionals,¹⁰ medical professionals,¹³ healthcare workers.¹²

Rationale and aim of the study: With this systematic review, we aim to address the lacunae of compiled data regarding knowledge, attitude and practice among dental professionals globally. Therefore, the aim of this systematic review is to determine the global status of knowledge, attitude and practice regarding tobacco cessation intervention among dental healthcare professionals. The secondary aim of the systematic review is to identify the most common barriers faced during tobacco cessation intervention among dental healthcare professionals and their perception towards inclusion of tobacco cessation activities in their curriculum.

Methodology

The systematic review was conducted according to the PRISMA guidelines. The protocol was registered with Prospero (Trial Number: CRD42021250962).

Search sources

The search was conducted electronically on PubMed, LILACS, Web of Science, Cochrane, CINAHL and Scopus databases from 15th May 2021 to 3rd September 2021 without any restriction of languages and from the year 2000 up till 2021. A search of the grey literature was performed in Google Scholar and Open-Grey. Two authors (NT and HP) performed the literature search independently according to a predefined strategy, and the duplicates were removed using EndNote software.

Search strategy

The 3 reviewers (HP, BMP and NT) identified the possible domains and subdomains using the PICO strategy to recognise the existing related literature on knowledge, attitude and practice on tobacco cessation intervention.

P : Dental Professionals; I : Tool for assessment of knowledge, attitude, practice of the tobacco cessation methods; Comparison: Not applicable; Outcome: Knowledge score, attitude score ,practice score, inclusion of tobacco cessation interventions in curriculum, barriers of the dental professionals regarding tobacco cessation interventions and responses of participating dental professionals in percentage.

The search was implemented using the keywords : Tobacco Cessation, Tobacco Counseling, Quitting Tobacco, Smoking and Smokeless Tobacco, Dental Professionals. Partial search was done using the boolean operators (AND, OR) with the keywords. The search strategy was carried out using the keywords and MeSH terms provided in [Supplementary Table 1](#).

Study selection and eligibility criteria

All types of published studies (Cross-sectional, case control, cohort) assessing the knowledge, attitude and practice regarding tobacco cessation counseling among dental professionals were included. Similar studies assessing barriers to tobacco cessation counseling and inclusion of tobacco cessation in the dental curriculum was also included in this review. Randomized clinical Trials and studies with inadequate information regarding methods of development and validation was excluded. Letter to the Editor, Perspective and commentaries were also excluded.

Assessment of risk of bias

The included studies were evaluated for their methodological quality using the Newcastle-Ottawa Quality Assessment Scale¹⁴: Critical appraisal checklist for analytic cross sectional studies by BMP, USB, DA and MDB independently. In case of any disagreement between the reviewers, a fifth reviewer was consulted. Based on their methodological quality, the studies were divided into high, moderate and low risk of bias.

Results

The search strategy yielded a total of 3726 articles from the databases of PubMed, LILACS, Web of Science, Cochrane, CINAHL, and Scopus ([Figure 1](#)). Following removal of articles for duplication, 104 articles were found to be eligible for assessment. A total of 48 studies were further excluded as full text was not available, the survey instrument was not validated, study designs consisted of narrative review, systematic review, intervention studies, knowledge, attitude and practice component was not assessed in many studies and 1 study was conducted among school students.

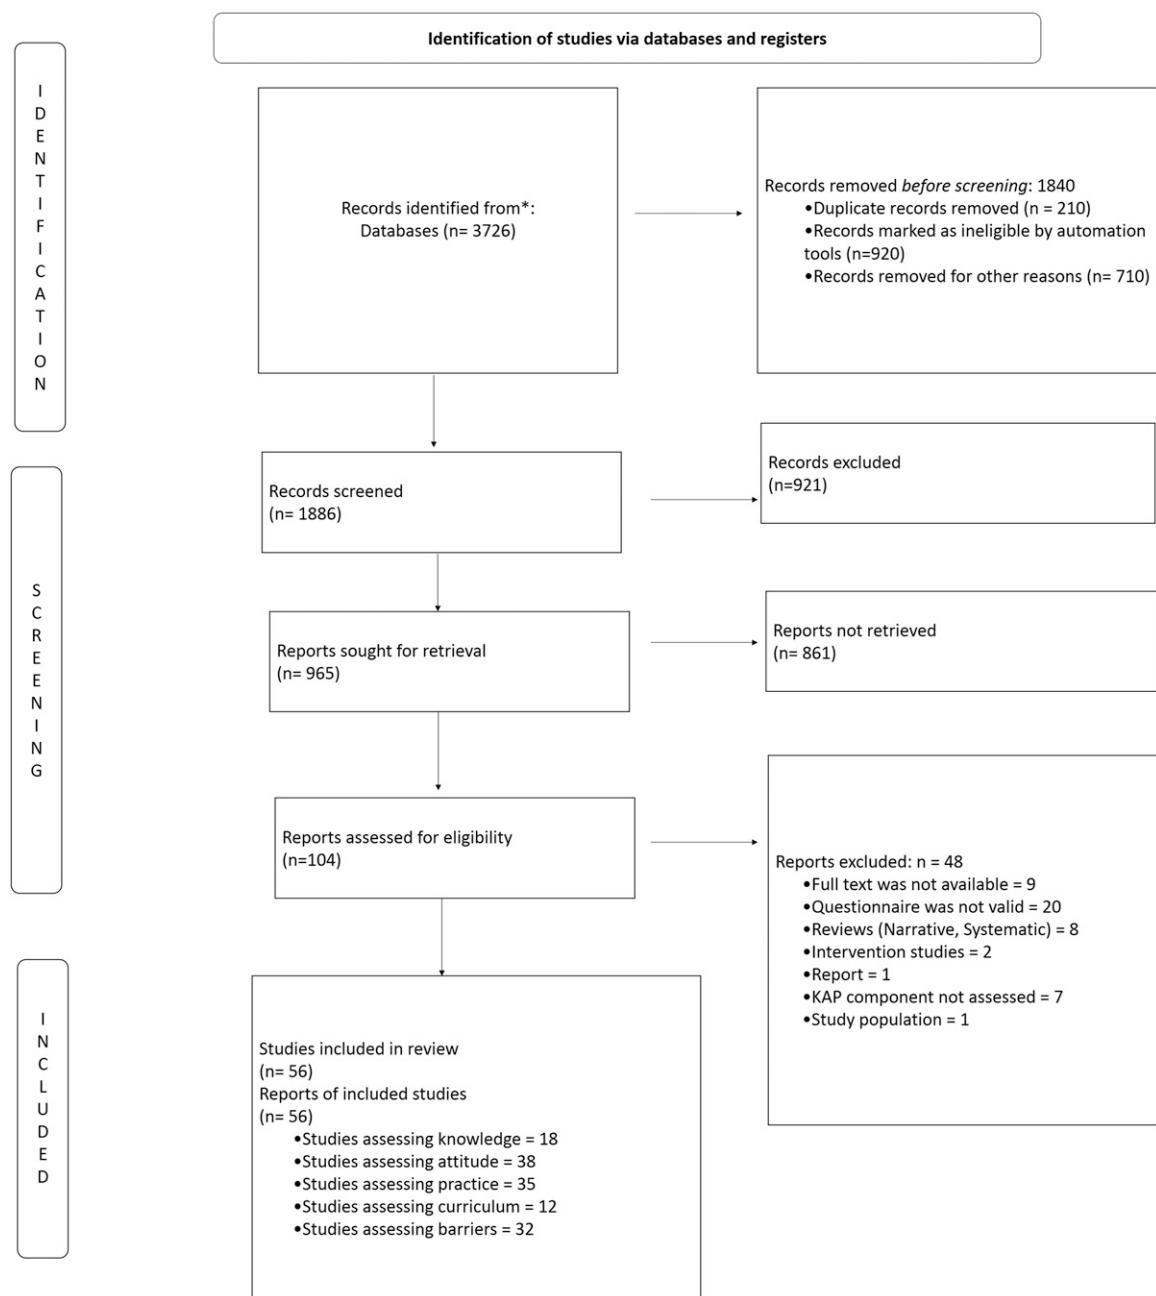

Figure 1. PRISMA flowchart.

Among the fifty six included studies, the majority (twenty-one) of the studies were conducted in South East Asia Region countries, followed by 9 studies in Eastern Mediterranean Region. A total of twenty six studies¹⁵⁻⁴⁰ were conducted among dental students and interns, 3⁴¹⁻⁴³ among dental hygienists, twenty two^{27,29-32,44-56} among dental practitioners, 3⁵⁷⁻⁵⁹ among pediatric dentists and 2^{60,61} among oral surgeons (Table 1).

Based on the inclusion criteria, all the studies had included a validated tool, 3 studies^{15,36,54} have used the Global Health Professions Student Survey (GHPSS) tool, whereas 2 studies^{17,21} have used a modified version of the same.

Since the questions used to assess knowledge, attitude, and practise regarding tobacco cessation counseling varied a lot, the data was visualized using heatmaps (Figures 2 to 4), where the width of the columns represents the number of studies that included the question and the color represents the level of awareness, positive attitude, and practice as 25%, 25-50%, 50-75%, and >75%. The heatmap includes the questions which were a part of the questionnaire in at least 3 or more studies. The similar questionnaires were clubbed together.

A total of seventeen^{18,20,22,23,32,36,38,41,42,44,46,49,50,54,55,67,70} studies had questions related to knowledge about tobacco

Table 1. Study Characteristics of the included studies in the systematic review.

SL NO	AUTHOR YEAR	STUDY DESIGN	COUNTRY	STUDY SETTING, STUDY POPULATION	INSTRUMENT, NUMBER OF QUESTIONS	RESPONSE RATE (%)	MALES AND FEMALES (N)	AGE GROUP (YEARS)	OUTCOME OF THE STUDY
1.	Maharani D A et al ¹⁶ 2021	Descriptive Cross-sectional	Indonesia	30 Universities Dental School; Dental Students	Pre-Validated Questionnaire 11	21	M:215 F:1073	Mean Age = 21.5	Intention to provide TCC was significantly associated with more positive attitude recognizing TCC as a dentists' role ($P < .000$).
2.	Mehta A et al ⁴⁴ 2020	Descriptive Cross-sectional	India	Private Dental Clinics, Conference, CDEs; Private Clinicians	Validated tool 17	Not Mentioned	M:155 F:142	Grouped as ≤ 35 & ≥ 36	Younger dentists (≤ 35) performed significantly better than older dentists in attitude and practice towards TCC
3.	Podakowska E et al ¹⁷ 2020	Descriptive Cross-sectional	Poland; Italy	Medical University in Bialystok, Poland; Sapienza University of Rome, Italy; Dental Students	Modified GHFSS*	79.6	M:182 F:40	15 -≥ 25	A statistical significance ($P < .001$) was found among the students in their belief that health professionals should routine advise patients to stop smoking
4.	A C L Da Silva et al ¹⁵ 2019	Descriptive Cross-sectional	Brazil	School of Dentistry, Universidade Federal de Pernambuco; Dental Students	GHFSS* 38	77.3	M : 99 F:165	19-30	About 90% of the students believe that the probability of tobacco cessation increases if advice comes from a health professional
5.	Kachhwaha P et al ¹⁸ 2019	Descriptive Cross-sectional	India	Dental College; Dental Intern + Dental Students	Developed and Validated 17	Not Mentioned	M:33 F:67	Mean Age = 23.3 (SD = 6.2) - Intern Mean Age = 22.1 (SD = 1.1) - Undergraduate	A statistical significance ($P = .005$) was observed between UGs and PGs that TCCs provided by a dentist would help the patient in quitting tobacco
6.	Lorenzo Pouso et al ²⁰ 2019	Descriptive Cross-sectional	Spain	Faculty of Medicine and Dentistry of Santiago de Compostela; Dental Students	Validated 15	54.5	M:35.85	Mean Age = 22.6 (SD = 4.3)	94.2% of the students considered it appropriate to promote tobacco use cessation activities
7.	Liu D.C.Y et al ¹⁹ 2019	Descriptive Cross-sectional	Hong Kong	Prince Philip Dental Hospital; Dental Students	Pre-Validated 23	100	M:92 F:14	Not Mentioned	About 90.2% of the students believe TCC by dentists could assist patients to quit smoking
8.	Thomas J et al ²¹ 2019	Cross sectional	India	Dental college; Dental Students	GHFSS* Modified	85	M : 129 F : 241	Not mentioned	92% of the students considered education on tobacco use cessation to be the responsibility of dentists/doctors
9.	Al Maweni S et al ⁴⁵ 2018	Cross Sectional	Yemen	Yemen Dental Association meeting; General Dental Practitioners	Not mentioned 16	47.5	M:97 F:85	Not mentioned	71% of the dental professionals believe that questions regarding tobacco habits and cessation take time and it was found to be statistically significant ($P = .001$)
10.	Siddiqui A A et al ⁴⁶ 2018	Descriptive cross sectional	Saudi Arabia	Licensed practicing dentists in the Hall region; Dentists working with the Ministry of Health in the Hall region of Saudi Arabia	Developed and validated 7	70.5	M:102 F:39	Not mentioned	The association between knowledge and practice regarding giving advice by dentists to quit smoking was statistically significant ($P = .0001$)
11.	Bangera D et al. ⁴⁷ 2018	Descriptive Cross-sectional	UAE	hospitals, dental clinics, polyclinics, dental clinics in medical centres, and dental centres in primary healthcare centres in the Northern Emirates; Practicing Dentist	Face validated 22	89.3	M:106 F:142	<40 - ≥ 40	Good attitude was significantly higher ($P = \leq .01$) among non tobacco users (90.9%) compared to tobacco users (71.0%)
12.	Nor NAM et al ⁴⁸ 2018	Cross Sectional	Malaysia	Dental university	Validated tool	66.2%	M:29 F:76	Not mentioned	33.1% of patients believe that smoking cessation counselling was extremely helpful compared to what students perceived (5.7%, $P = <.01$)
13.	Alajmi B et al ⁴⁹ 2017	Descriptive Cross-sectional	Saudi Arabia, Kuwait	Saudi Commission for Health Specialities as well as the Kuwaiti Dental Association; Practicing Dentist	Validated tool	97.2%	M:286 F:180	Mean Age 32.7 ± 9.32	A non smoker status among the dentists was significantly associated with patient education ($P = .002$), giving quit advice to smokers ($P = .000$) and willingness to conduct a tobacco cessation campaign ($P = .000$)
14.	Resende M et al ⁵⁰ 2017	Analytical and descriptive longitudinal	Portuguese	Portuguese Dental Association; Portuguese Dentists	Validated tool 23	27.5	Not mentioned	23 - 59	Counseling for tobacco cessation has increased from 68% to 86.9% (2013) and it was found to be statistically significant ($P = < .001$)
15.	Yanya NA et al ⁵⁰ 2017	Descriptive Cross Sectional	Malaysia	Dentist registered in the Dental Practitioners' Management Information System (DPMIS) Malaysian Dental Council; Practising Dentists	Validated tool (Theoretical Domain Questionnaire)	100	M:55 F:88	Mean Age 37.1 (± 10.3)	Significantly more ($P < .05$) public (65.1%) than private (51.2%) dentists believed promoting tobacco cessation was an important professional duty
16.	Zaborowski A et al ²² 2017	Cross sectional	Lithuania	Lithuanian University of Health Sciences; Dental Students	Validated tool	84.2%	M:167 F:438	Mean Age = 33.7	The willingness to patient's smoking cessation was found to be statistically non significant among the 2 groups.
17.	Prabhu A et al ²² 2017	Descriptive Cross Sectional	India	College of Dental Sciences and Baqil Dental College, Davangere; Dental students	Validated tool 23	Not mentioned	M:120 F:142	20 - 27	The respondents did not have sufficient knowledge regarding tobacco cessation advice
18.	Rahman B et al ⁵¹ 2016	Cross Sectional	UAE	College of Dentistry in Ajman University of Science and Technology; dental students	Pre-validated 15	77%	M:140 F:130	17-26	A statistically significant ($P = .000$) was found between tobacco using patients and non using students about a dentist's role to assist a patient in stopping tobacco use

43.	Clareboats S et al. ⁵³ 2011	Cross Sectional	United Kingdom	Clinical dental	Validated tool	89	M:44% F:56%	Not mentioned	85.9% final year students and 53.1% entry level agreed talking about smoking in part of professional practice and it was statistically significant ($P = .002$)
44.	Pizzo G et al. ⁴² 2010	Cross sectional	Italy	University of Palermo; Dental Students, Dental Hygienists	Pre-validated (European Union Working Group on Tobacco and Oral Health) 20	Not mentioned	M : 100 F : 78	Not mentioned	99% believe TCC is important to be included in daily practice
45.	Saddichha S et al. ⁵⁴ 2010	Cross Sectional	India	NIMHANS; Dental Surgeons	GPHSS* 45	100	M:58 F:42	36.3 (SD:5.32)	87.3% agree that advising on tobacco use cessation is dentist's role however it is not significant
46.	Vered Y et al. ³⁷ 2010	Cross Sectional	Israel	Jerusalem Dental Medicine School; Dental Students	Validated tool	99	M:134 F:137	24-31-36	Most students were comfortable providing TCC to both smokers (92%) and split tobacco users (93%)
47.	Harris JL et al. ⁴⁸ 2009	Cross sectional	USA	12 Dental Hygienist Programs, Senior Dental Hygienists	Validated tool 26	65	M:5 F:151	18 – 35 and above	80% agree it is their duty to help patients to quit tobacco
48.	Mumtaz R et al. ⁵⁵ 2008	Cross Sectional	Pakistan	3 dental colleges + 3 tertiary dental hospitals; Dental students, Practising dentists	Validated tool	66,20	M : 119 F : 103	Not mentioned	56.3% agree smoking cessation activities are peripheral to dentistry
49.	Yee C et al. ⁵⁹ 2008	Cross Sectional	USA	AAPD members; Pediatric dentists	Validated tool 26	82	M : 813 F : 479	43 years	80% agree it is their duty to help patients to quit tobacco
50.	Crews KM et al. ⁵¹ 2008	Descriptive	USA	American Association of Oral Maxillofacial Surgeons; Oral Surgeons	Pre-validated tool 38	52,4	M:264 F: 96	56.3 ± 8.7 years	Respondents with formal training in providing treatment for tobacco dependence were more likely than respondents without training to report that they counsel at least 51% of their patients ($\chi^2 = 63.13, P < .01$)
51.	Gansky SA et al. ⁵⁶ 2007	Cross Sectional	USA	AAPD members; Pediatric dentists	Validated tool 45	65	M:75% F: 25%	≤39 - ≥50 years	56% agree it is their duty to help patients to quit tobacco
52.	Vanrobergen J et al. ³⁸ 2007	Cross Sectional	Belgium	Ghent university; Dental students	Validated tool	81	M: 38% F: 62%	Mean – 21-29+ 41-61	40% agree it is the responsibility and duty of every dentist to co-operate in anti-tobacco programs
53.	Polychonopoulou et al. ⁵⁰ 2004	Cross Sectional	Greece	University of Athens Dental school; Dental students	Validated tool	97,60	M: 72 F: 93	Not mentioned	80% considered tobacco cessation counseling a duty of every dentist
54.	Victoroff KZ et al. ⁴⁰ 2004	Cross Sectional	USA	Midwestern dental school; 1 st year dental students	Validated tool 26	99	M : 104 F : 35	Not mentioned	Attitudes of incoming dental students appear to be positive regarding the dental professional's responsibility to educate patients about the risks of tobacco use.
55.	Rikard Bell G et al. ⁵⁶ 2003	Cross Sectional	Australia	Australian Dental Association	Validated tool	88	M:120 F:112	≤21 and above	Student's confidence to counsel smokers to quit was low and did not differ significantly by year ($P = .42$)
56.	Shenkin JD et al. ⁵⁷ 2003	Cross Sectional	USA	AAPD Annual meeting; Paediatric dentists	Validated tool 11	Not mentioned	M : 98 F : 75	≤ 30 – 70 or more	21% believe in the role of paediatric dentists in stopping adolescents from smoking

*GPHSS = Global Health Professions Student Survey

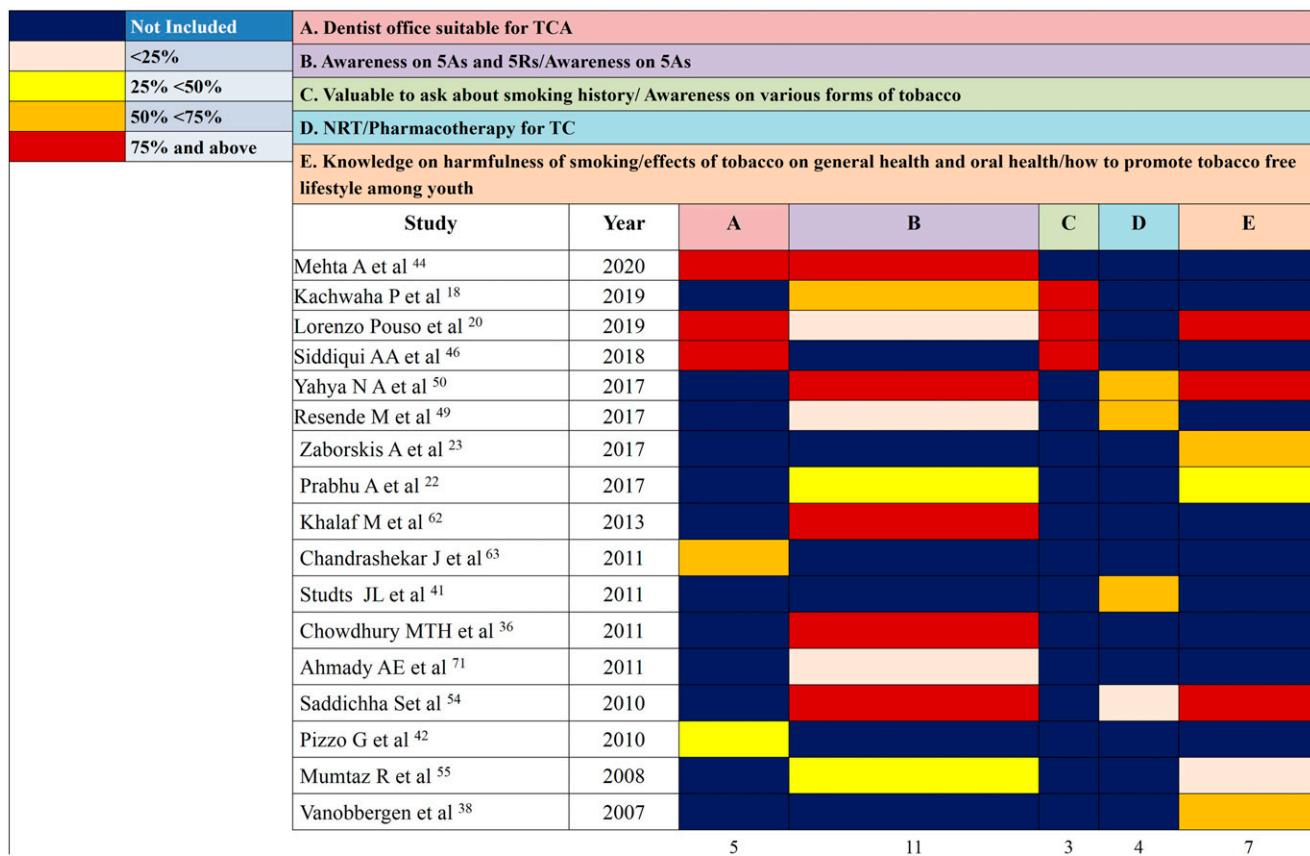

Figure 2. Heatmap of questions on knowledge towards tobacco cessation interventions.

cessation counseling (Figure 2), among which eleven^{18,20,22,32,36,44,49,50,54,55,67} studies assessed the awareness on 5As and 5R where the knowledge score was found to be in the range of 75% and above in only 5 studies.^{36,44,50,54,67} Awareness on various forms of tobacco was reported in only 3 studies^{18,20,46} and in all 3 studies, the knowledge score was high. Knowledge on NRT/pharmacotherapy was also reported in studies conducted by Yahya NA et al,⁵⁰ Resende M et al,⁴⁹ Studts JL et al⁴¹ and Saddichha S et al⁵⁴ and in majority it was found to be between 50–75%.

Figure 3 depicts thirty seven studies^{15-18,23-26,28-33,36,37,39-42,44-46, 48-50,52,55-57,61,64,65,68,70,71} which assessed the attitude of dental professionals towards tobacco cessation counseling. A positive attitude was observed among the dental professionals in the majority of the studies^{18,23-25,28-33,37,39-42,46,48,49,55-57,61,64,65,68,70} regarding advising patients to quit tobacco. Responses to negative impact of tobacco cessation counseling were also included and studies^{16,18,24,30,32,33,40-42,45,50,52,56,70,65,71} were found to be less negative towards tobacco cessation counseling as a part of clinical practice.

Among the thirty four studies^{18,19,22,26,28-30,33-35,37,41,43-51,54-56,58,59,61,67,70,68} which assessed the practice among dental professionals on tobacco cessation counseling (Figure 4), this review found that dental professionals were in the practice of conducting tobacco cessation counseling.^{18,19,30,33-35,43,46,47,49,50,54,56,66}

The practice of 5As was followed more as compared to 5Rs, as evident from Figure 4. It was also observed that brief counseling was more prevalent as compared to prescribing NRT,^{22,29,35,37,43,49,51,59,68,66} drugs.^{22,41,44,49,68,66}

All twelve studies^{15,21,30,35,36,44,46,49,57,58,68,66} reported that study participants had a formal training in tobacco cessation (Figure 5) and among thirty one^{16, 18,19,22,26,28-33,35,37,39,41,42,44,48,50,52,53,55,56,58,59,61,67,70,66,68,71} studies which assessed barriers related to tobacco cessation interventions (Figure 6), time and training were cited to be the most common barriers.

Risk of bias analysis was conducted using Newcastle Ottawa scale¹⁴ (Table 2). Upon quality assessment, 9 studies^{17,28,30,32,47,51,54,70,64} had high quality of evidence, thirty six studies^{15,16,19,22,24-27,29,31,33-37,41,44,48-50,53,55,59,67,65,62,63,66,69,71} were of moderate quality.

In this current study, quality analysis (Table 3) was done using GRADE to highlight crucial information about the quality of evidence of the included studies. The quality of evidence for all the studies was found to be moderate.

Discussion

The habit of tobacco consumption is one of the biggest public health threats the world is facing where about 8 million people a year around the world are affected.⁷² Tobacco cessation

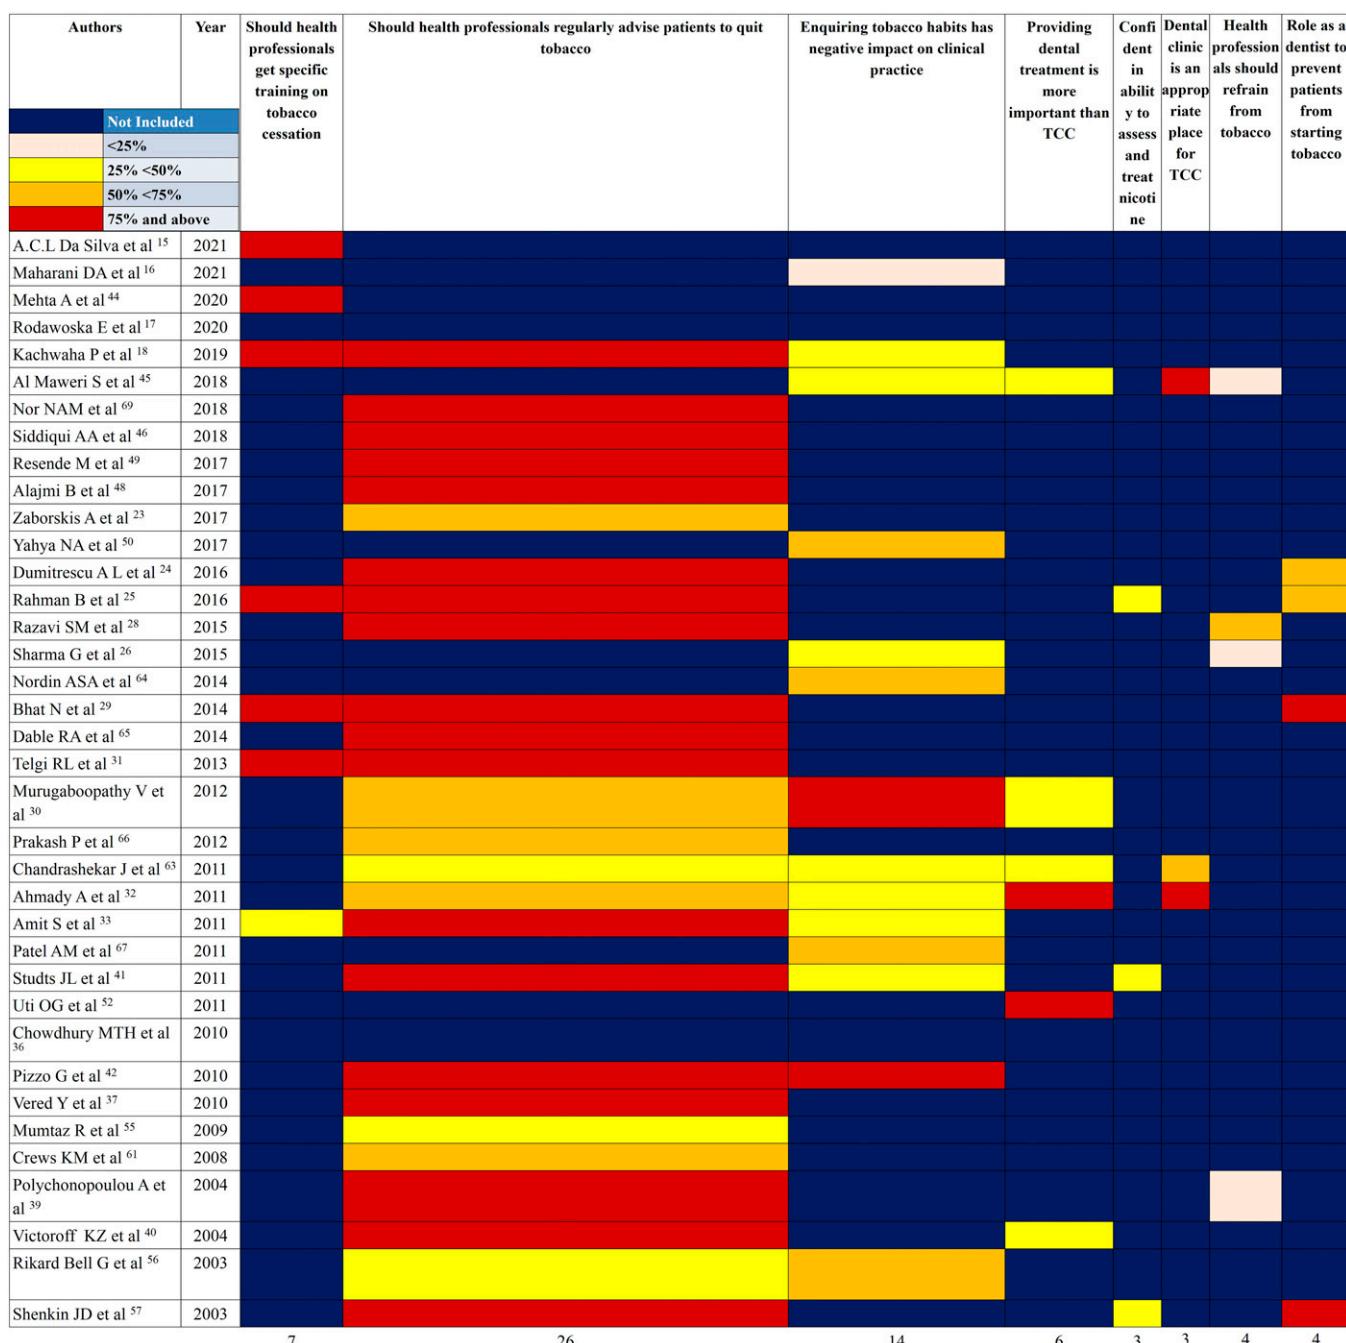

Figure 3. Heatmap of questions on attitude towards tobacco cessation interventions.

interventions must be advocated strongly to result in benefits over manifolds for the tobacco users.⁷³ For healthcare professionals, providing tobacco cessation counseling should be one of the key roles. Especially for dental professionals, it is implied that it is an obligation which is required to restrict the consumption of tobacco.⁷⁴ Despite this, there is a lack in evidence generated data on the knowledge, attitude or perception and practice of dental professionals on tobacco cessation interventions.

Studies included in this systematic review have assessed the knowledge, attitude and practice regarding tobacco cessation interventions among healthcare professionals, however, no

study has collated the data therefore, this current study was conceptualized to quantitatively assess those various studies in order to identify useful information which may be used for future development of a standardized questionnaire or methodology for tobacco cessation interventions.

Studies from developed nations are lesser in comparison, the reason for which could be an already existing system of tobacco cessation interventions among those nations.^{75,76} Since, the prevalence of tobacco is higher in the developing countries,⁷⁵ there should be provisions for generating awareness regarding tobacco cessation counseling among the healthcare professionals. Regarding the knowledge component, eleven

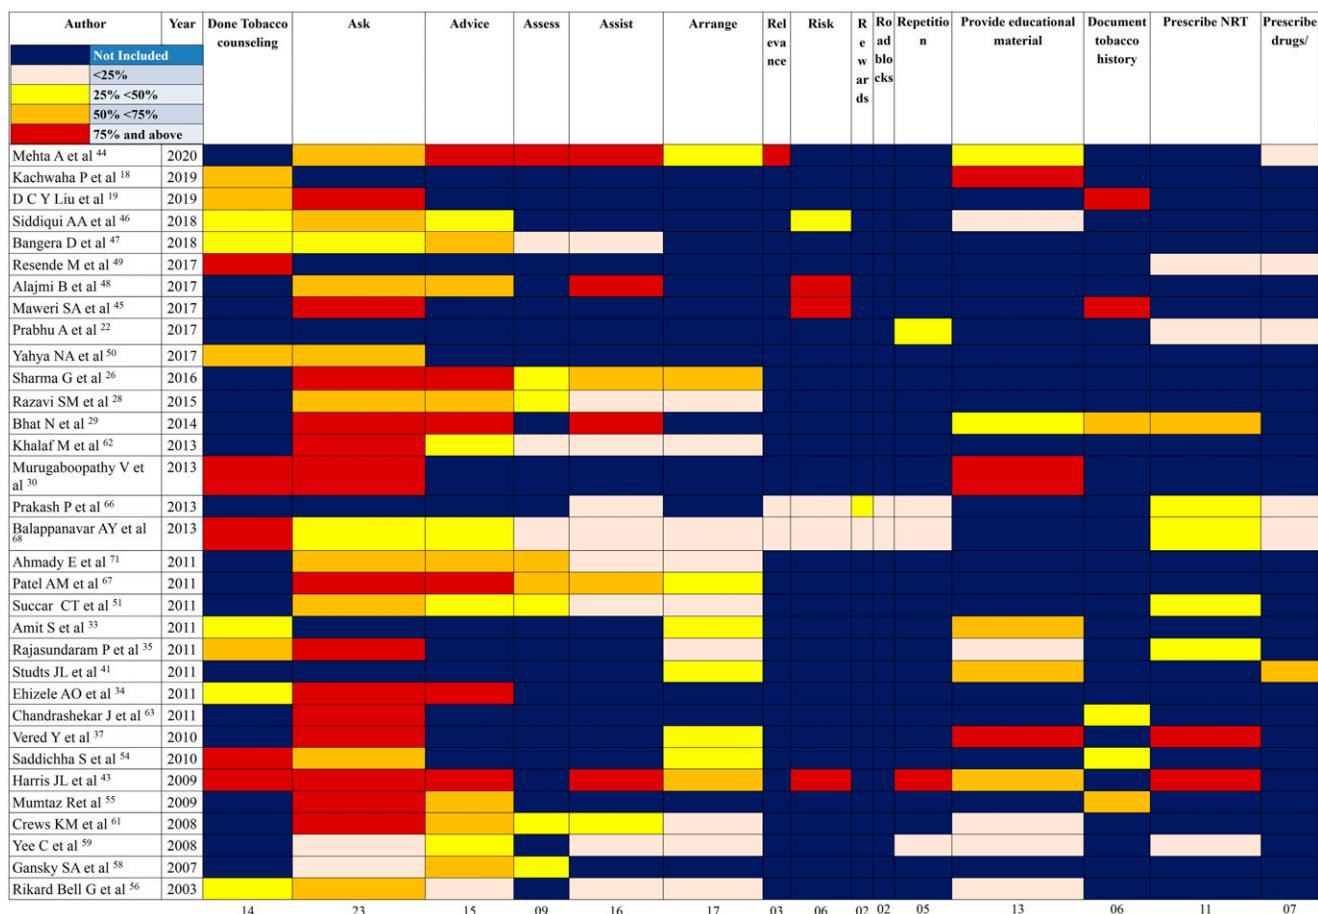

Figure 4. Heatmap of questions on practice towards tobacco cessation interventions.

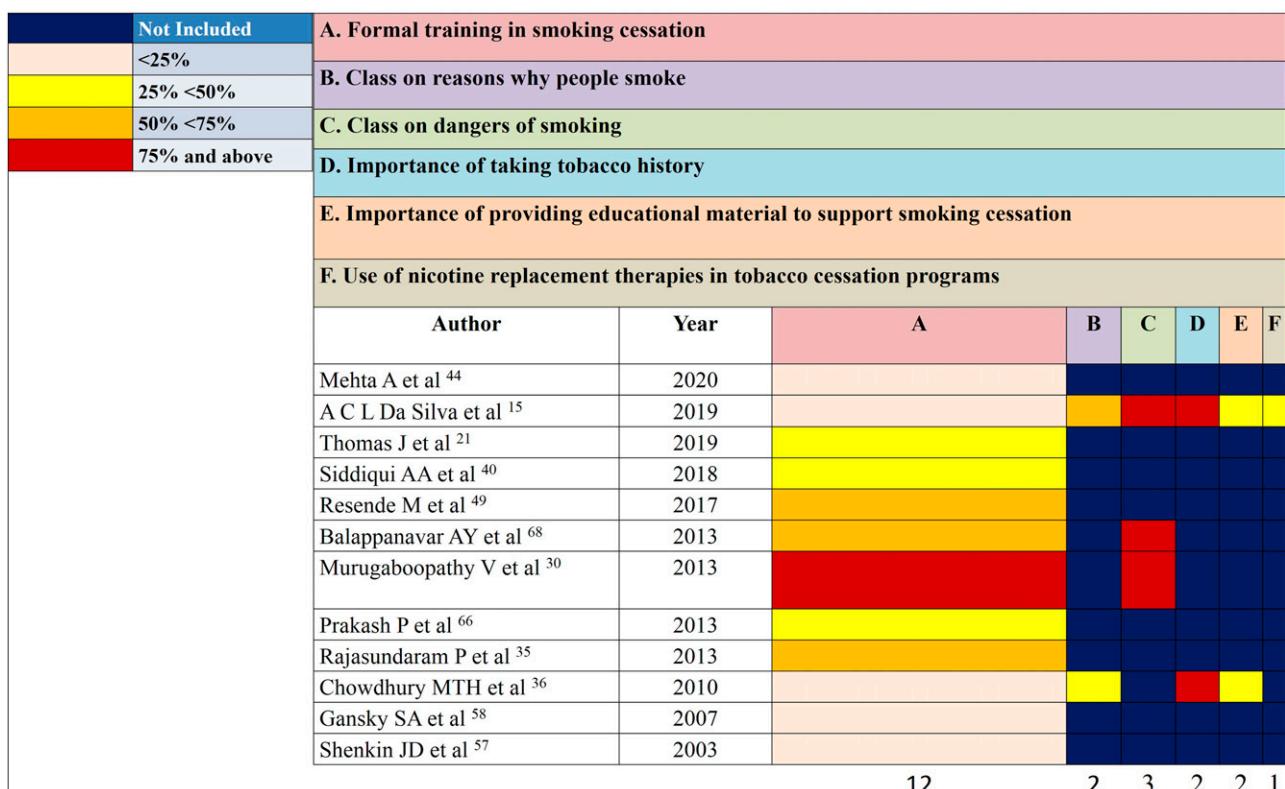

Figure 5. Heatmap of questions on curriculum on tobacco cessation interventions.

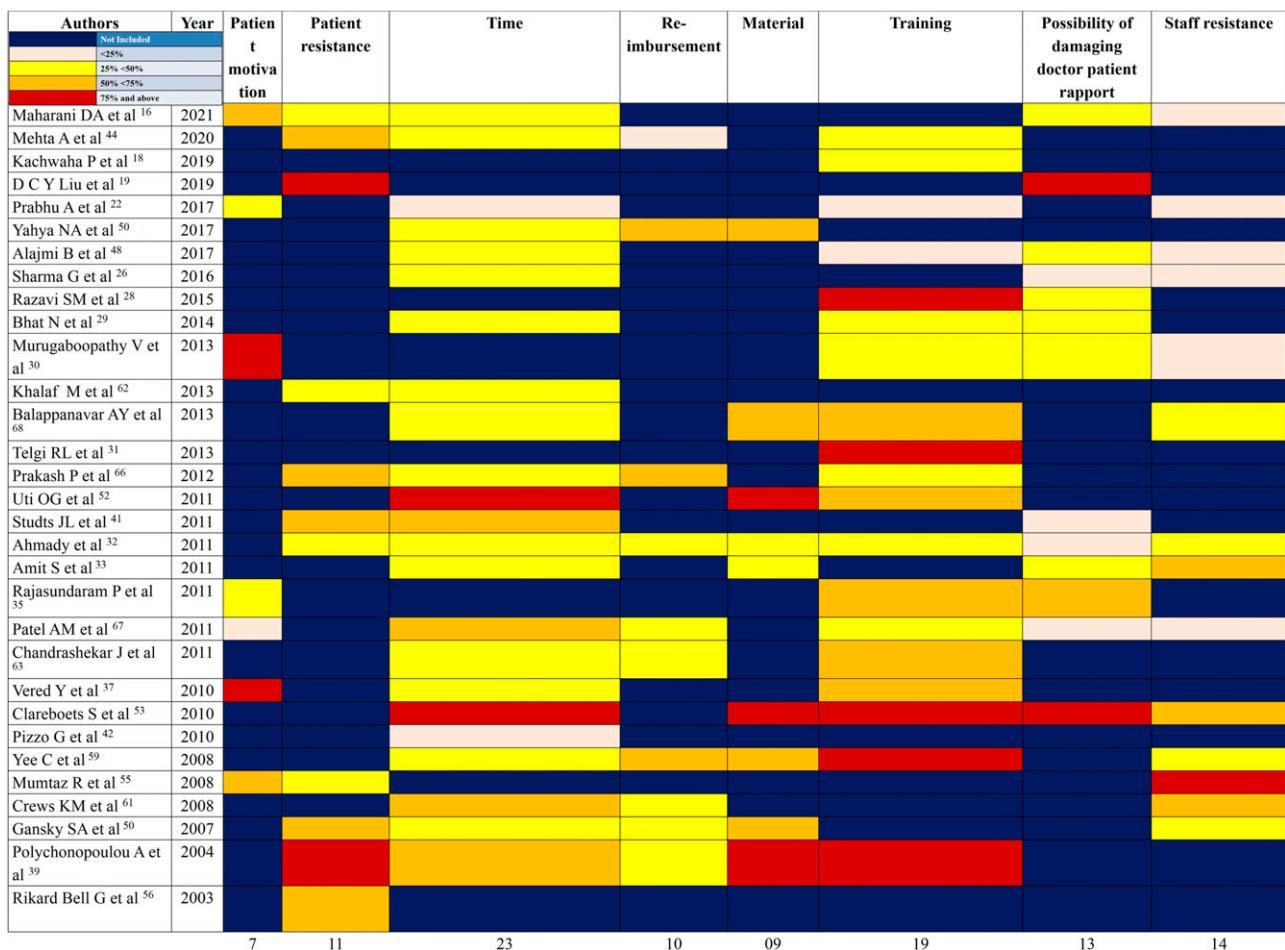

Figure 6. Heatmap of questions on barrier towards tobacco cessation interventions.

studies^{18,20,22,32,36,44,49,50,54,55,67} assessed the awareness on 5As and 5Rs of tobacco cessation and among those, 5 studies^{36,44,50,54,67} showed awareness to be above 80%, however in certain studies^{18,58,59} the practice of 5As was found to be as low as 11%,¹⁸ therefore there is a further need to incorporate 5As as a major intervention for tobacco cessation, as it is an established method of brief tobacco counseling which is not time consuming.

Four studies^{41,49,50,54} enquired on the knowledge of Nicotine Replacement Therapy/Pharmacotherapy among the healthcare professionals and it was below 75% among all studies. Attitude of the healthcare professionals is another crucial component while providing tobacco cessation counseling. Most of the studies had included questions evaluating the same. More than 75% of the healthcare professionals in about eighteen studies^{18,24,25,28,29,31,33,37,39-42,46,48,49,57,64,62} showed a positive attitude towards advising patients to quit tobacco. Similar findings were reported by Goel D,⁷⁷ where favorable attitudes were observed in spite of poor practice regarding tobacco counseling. In 7 studies^{18,26,32,33,41,45,70} 25-50% of the healthcare professionals believe enquiring on

tobacco habits leads to a negative influence on clinical practice.

This attitude among healthcare providers must be altered through training and thus create a positive impact for the patients. Various studies have remarked on the effectiveness of tobacco cessation counseling training for healthcare providers.⁷⁸⁻⁸⁰ Training programs are also shown to change the attitude of the healthcare professionals in tackling the barriers towards tobacco cessation counseling.⁸¹ The training programs must be comprehensive, tailor made to target different sectors of population and must be reinforced at regular intervals, based on the current dynamic policies⁸² and program developments on tobacco control.

Out of twenty three studies, fourteen studies^{19,26,29,30,34,35,37,43,45,55,61,67,70,71} reported that the healthcare professionals ask the patients about their tobacco consumption and it was found to be around more than 75%, as depicted in the heatmap. It is evident from the findings that compared to practice of 5Rs, more dental professionals practice 5As. This finding is partly consistent with a systematic review of doctor's smoking status and their practice towards tobacco cessation interventions.¹³

Only ten studies^{22,29,35,37,43,49,51,59,68,66} reported the dental professionals were in the practice of prescribing NRT, which is very low and efforts must be undertaken to educate the dental professionals on NRT and pharmacotherapy as well. The most common barriers in providing tobacco cessation counseling as enlisted by the studies were time,^{16, 22,26,29,32,33,37,39,41,42,44,48,50,52,53,58,59,61,67,70,66,68,71} followed by training,^{18,22,28-32,35,37,39,44,48,52,53,59,66,68,71} and this similar finding was reported in a study conducted among African healthcare workers as well¹²

The findings from this systematic review suggests that there is a need to develop and validate a standardized questionnaire to assess the knowledge, attitude and practice of tobacco cessation counseling among healthcare professionals.

There is lack of homogeneity among the included studies with regard to the questionnaires used, study population, therefore meta-analysis could not be done for the current study. There is a difference in the outcome measures of the studies as many studies have assessed either knowledge, attitude or practice rather than the entire KAP component, therefore it is difficult to compare and draw conclusions regarding the same. None of the studies have deducted any knowledge, attitude and practice score from their findings, hence it was not possible to quantify the knowledge, attitude and practice level.

Future implications and recommendation

The results imply that there is an urgent requirement to modify the current dental education curriculum to improve dental student's involvement in tobacco control, as before entering the workforce, students should have tobacco cessation intervention training during their academic years.

Conclusion

The current findings of this systematic review shows that knowledge regarding aspects of tobacco cessation among dental professionals was lacking in developing countries. In spite of a favorable attitude towards tobacco cessation intervention, practice of conducting tobacco cessation counseling was not prevalent. A well designed structured questionnaire should be developed and validated for international comparisons to assess the knowledge, attitude and practice among healthcare professionals. The above stated recommendations could be incorporated in future studies assessing knowledge, attitude and practice among healthcare providers.
