

Tetraaquabis(pyridine-3-sulfonato- κN)-nickel(II)

Bing-Yu Zhang, Jing-Jing Nie and Duan-Jun Xu*

Department of Chemistry, Zhejiang University, Hangzhou 310027, People's Republic of China

Correspondence e-mail: xudj@mail.hz.zj.cn

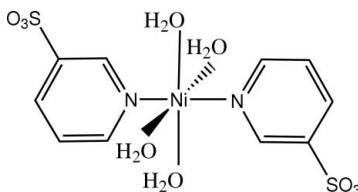

Received 8 April 2008; accepted 13 April 2008

Key indicators: single-crystal X-ray study; $T = 295\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.024; wR factor = 0.065; data-to-parameter ratio = 13.3.

In the molecule of the title compound, $[\text{Ni}(\text{C}_5\text{H}_4\text{NO}_3\text{S})_2(\text{H}_2\text{O})_4]$, the Ni^{II} cation is located on an inversion center and is coordinated by four water molecules and two pyridine-3-sulfonate anions with an NiN_2O_4 distorted octahedral geometry. The face-to-face separation of $3.561(5)\text{ \AA}$ between parallel pyridine rings indicates the existence of weak $\pi-\pi$ stacking between the pyridine rings. The structure also contains intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonding and weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonding.

Tetraaquabis(pyridine-3-sulfonato- κN)nickel(II)

B.-Y. Zhang, J.-J. Nie and D.-J. Xu

Comment

As π - π stacking between aromatic rings plays an important role in electron transfer process in some biological system (Deisenhofer & Michel, 1989), π - π stacking has attracted our much attention in past years (Su & Xu, 2004; Liu *et al.*, 2004; Li *et al.*, 2005). In order to investigate the influence of substituents on aromatic stacking, the title pyridine-sulfate complex has recently prepared and its crystal structure is reported here.

The molecular structure of the title compound is shown in Fig. 1. The Ni^{II} cation is located in an inversion center and coordinated by four water molecules and two pyridine-3-sulfonate anions with a NiN₂O₄ distorted octahedral geometry (Table 1), similar to the analogue of Zn^{II} (Walsh & Hathaway, 1980). Partially overlapped arrangement is observed between parallel pyridine rings (Fig. 2). The face-to-face separation of 3.561 (5) Å between parallel pyridine rings is shorter than the van der Waals thickness of an aromatic ring (3.70 Å; Cotton & Wilkinson, 1972), and indicates the existence of weak π - π stacking between the pyridine rings.

The intermolecular O—H \cdots O hydrogen bonding and weak C—H \cdots O hydrogen bonding (Table 2) help to stabilize the crystal structure.

Experimental

Pyridine-3-sulfonic acid (0.159 g, 1 mmol), Na₂CO₃ (0.053 g, 0.5 mmol), NiCl₂.6H₂O (0.238 g, 1 mmol) were dissolved in a mixture solution of water (8 ml) and ethanol (2 ml). The solution was placed in a 15 ml Teflon-lined stainless steel autoclave under autogenous pressure at 398 K for 75 h and filtered after cooling to room temperature. The blue single crystals of the title compound were obtained from the filtrate after 3 months.

Refinement

Water H atoms were located in a difference Fourier map and refined as riding in as-found relative positions with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Aromatic H atoms were placed in calculated positions with C—H = 0.93 Å and refined in riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.024$	H-atom parameters constrained
$wR(F^2) = 0.065$	$w = 1/[\sigma^2(F_o^2) + (0.0323P)^2 + 0.5265P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1524 reflections	$\Delta\rho_{\text{max}} = 0.29 \text{ e \AA}^{-3}$

115 parameters $\Delta\rho_{\min} = -0.37 \text{ e } \text{\AA}^{-3}$
 Primary atom site location: structure-invariant direct Extinction correction: none
 methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
