

Supplemental figure 1

**Supplemental Figure 1: Comparison of sBCMA levels between nonPD and PD patients**

Soluble BCMA (sBCMA in pg/ml on x-axis) levels in serum were measured at time of leukapheresis (apheresis) and days 30 and 100 following CAR T cell infusion (y-axis). Significant differences between both groups were assessed at all three different timepoints. For the calculation of significances Mann-Whitney U test was used. \*\*  $p < 0.01$ , \*\*\*  $p < 0.001$ .
