Received 7 April 2015; accepted 11 April 2015

Edited by W. T. A. Harrison, University of Aberdeen, Scotland

In the title compound, $\mathrm{C}_{8} \mathrm{H}_{7} \mathrm{ClFNO}$, the F atom is disordred over the meta positions of the benzene ring in a 0.574 (4):0.426 (4) ratio and the Cl atom is syn to the O atom $\left[\mathrm{O}-\mathrm{C}-\mathrm{C}-\mathrm{Cl}=5.6(3)^{\circ}\right]$. A short intramolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contact occurs. In the crystal, molecules are linked into amide $C(4)$ chains propagating in [101] by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

Keywords: crystal structure; disordered F atom; $N$-arylamides; hydrogen bonding.

CCDC reference: 1049536

## 1. Related literature

For compounds in which the meta fluorine substituent of a benzene ring exhibits positional disorder, see: Nayak et al. (2012); Sanjeevarayappa et al. (2015).

## Crystal structure of 2-chloro- N -(3-fluorophenyl)acetamide

S. Sreenivasa, P. A. Suchetan, S. Naveen, N. K. Lokanath and K. S. Srivishnu

## S1. Synthesis and crystallization

The title compound (scheme 1) was synthesized by the reaction of 2-chloroacetyl chloride with 3-fluoroaniline at room temperature. The reaction mixture was poured into crushed ice and the resulting solid was washed thoroughly with water, dilute hydrochloric acid and filtered.
A small portion of the resulting compound was taken in a 10.0 ml beaker and dissolved in a 1:1 ratio of a mixture of $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ to obtain colourless prisms by a slow evaporation method at $\sim 24^{\circ} \mathrm{C}$.

## S2. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1. The H atoms of the NH groups were located in a difference map and later restrained to $\mathrm{N}-\mathrm{H}=0.86$ (4) $\AA$. The other H atoms were positioned with idealized geometry using a riding model with $\mathrm{C}-\mathrm{H}=0.93-0.96 \AA$. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the $U$ eq of the parent atom).

## Figure 1

A view of the molecular structure of (I), with displacement ellipsoids drawn at the $50 \%$ probability level.

Figure 2
Crystal packing of (I). $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are shown as dotted lines.

## Special details

Experimental. Melting point was determined by using open capillary. FT—IR Spectrum was recorded on Jasco FT—IR Spectrometer. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on Jeol- 400 MHz NMR instrument using DMSO-d6 as solvent. Chemical shift values were expressed in $\delta$ (p.p.m.) relative to tetramethylsilane (TMS) as an internal reference standard. Mass spectrum of the compound was recorded on Shimadzu LC-2010EV with ESI probe. The analysis of various spectra are as follows.
IR wavenumbers $\left(\mathrm{cm}^{-1}\right)$ : $\mathrm{C}=\mathrm{O} 1674.9, \mathrm{C}-\mathrm{N} 1348-1060$, $\mathrm{N}-\mathrm{H} 3510-3120, \mathrm{C}-\mathrm{N}-\mathrm{C} 515-409, \mathrm{C}-\mathrm{Cl} 850-550, \mathrm{C}-\mathrm{Cl}$ 650-515. ${ }^{1} \mathrm{H}-\mathrm{NMR}(399.6 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d} 6) \delta: 10.49(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 7.57-7,55(\mathrm{dd}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.34-7.27(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-$ H), 6.88-6.83 (m, 1H, Ar-H), 2.47 (s, 2H, -CH2-). ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz}$, DMSO-d6) $\delta: 165.41,163.76,140.67$, 130.89, $115.54,110.80,106.77,43.92$. MS: Predicted Mass: 187.07; Obtained Mass 188.07 (M+1).
Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
