

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

Corrigendum

Corrigendum to “Prevalence of depression, anxiety, and insomnia among healthcare workers during the COVID-19 pandemic: A systematic review and meta-analysis” [Brain Behav. Immun. 88 (2020) 901–907]

The authors regret that a number of inaccuracies have been noted in Table 2 detailing the Modified Newcastle-Ottawa Scale quality assessment scores. The study Huang J.Z. et al. had been taken into account during the quality assessment process and included in the original submission but was replaced by the word “Author” and some studies have changed order in the table during the production process. Furthermore, Du et al. and Zhang W. et al. were not assigned a star; with an additional star, Du et al. becomes low risk of bias whereas Zhang et al. remains low risk of bias. No star had been allocated in the original table

for the response rate of Du et al. and this has been also rectified as shown in the corrected table below. The changes in the quality assessment score also affect the pooled estimates of low bias risk studies as Du et al. becomes low risk of bias. The adjusted low risk of bias values are 23.78% (instead of 24.06%) (95% CI 16.95%–31.34%, $I^2 = 99\%$) for Anxiety in 10 studies and 21.75% (instead of 22.93%), (95% CI 12.72%–32.34%, $I^2 = 99.62\%$) for Depression in 9 studies.

The authors would like to apologise for any inconvenience caused.

Table 2

Modified Newcastle-Ottawa quality assessment scale and total score of each study.

Studies	Year	Modified Newcastle-Ottawa quality assessment scale					Score
		1	2	3	4	5	
Du et al.	2020	*	–	–	*	*	3

Zhang W. et al.	2020	*	*	–	*	*	4
Zhu et al.	2020	–	*	–	*	*	3

1. Representativeness of sample (no HCWs' subgroup $\geq 65\%$ of total sample); 2. Sample size > 600 HCWs; 3. Response rate > 80%; 4. The study employed validated measurement tools with appropriate cut-offs; 5. Adequate statistics and no need for further calculations.
