## Abstract:

Rule-based modeling is an approach that permits constructing reaction networks based on the specification of rules for molecular interactions and transformations. These rules can encompass details such as the interacting sub-molecular domains (components) and the states such as phosphorylation and binding status of the involved components. Fine-grained spatial information such as the locations of the molecular components relative to a membrane (e.g. whether a modeled molecular domain is embedded into the inner leaflet of the cellular plasma membrane) can also be provided. Through wildcards representing component states entire families of molecule complexes sharing certain properties can be specified as patterns. This can significantly simplify the definition of models involving species with multiple components, multiple states and multiple compartments. The SBML Level 3 Multi Package (Multistate, Multicomponent and Multicompartment Species Package for SBML Level 3) extends the SBML Level 3 core with the “type” concept in the Species and Compartment classes and therefore reaction rules may contain species that can be patterns and be in multiple locations in reaction rules. Multiple software tools such as Simmune and BioNetGen support the SBML Level 3 Multi package that thus also becomes a medium for exchanging rule-based models.

# 1 Introduction

This Multistate, Multicomponent and Multicompartment Species (Multi) package provides an extension of SBML Level 3 [Hucka et al. (2016)] that supports encoding `models` with molecular complexes that have multiple components and can exist in multiple states and in multiple `compartments`. One of its goals also is to provide a platform for sharing `models` based on the specifications of bi-molecular interactions and the rules governing such interactions [Angermann et al. (2012); Feret et al. (2009); Hlavacek et al. (2006); Zhang et al. (2013)]. This specification covers the goals and features described in the previous Multi proposal [Le Novère and Oellrich (2010)] for extending SBML to carry the information for *multistate multicomponent species* with revised data structure. In addition, this specification includes the feature for *multicompartment species* as described in the releases of the Multi proposal [Zhang and Meier-Schellersheim (2013a), Zhang et al. (2012)].

## 1.1 Proposal and specifications

The proposal corresponding to this package specification is available at:

[http://sbml.org/Community/Wiki/SBML\\_Level\\_3\\_Proposals/Multistate\\_and\\_Multicomponent\\_Species\\_Proposal](http://sbml.org/Community/Wiki/SBML_Level_3_Proposals/Multistate_and_Multicomponent_Species_Proposal)

The specifications (v1.0.1 to current) are located at:

<https://sourceforge.net/p/sbml/code/HEAD/tree/trunk/specifications/sbml-level-3/version-1/multi/spec/>

## 1.2 Package dependencies

The Multi package has no dependencies on other SBML Level 3 packages.

## 1.3 Document conventions

UML 1.0 notation is used in this document to define the constructs provided by this package. Colors in the diagrams carry the following additional information for the benefit of those viewing the document on media that can display color:

- **Black** Items colored black are components taken unchanged from their definitions in the SBML Level 3 Core specification document.
- **Green** Items colored green are components that exist in SBML Level 3 Core, but are extended by this package. Class boxes are also drawn with with dashed lines to further distinguish them.
- **Blue** Items colored blue are new components introduced in this package specification. They have no equivalent in the SBML Level 3 Core specification.

For other matters involving the use of UML, XML and typographical conventions, this document follows the conventions used in the SBML Level 3 Core specification document [Hucka et al. (2016)].

For simplicity, “...” in all example code refers to some unspecified code content, that is not important for the purpose of illustrating the issue at hand.

## 2 Background and context

Rule-based, domain-detailed modeling has been extremely valuable in systems biology related studies [Manes et al. (2015) and Miskov-Zivanov1 et al. (2013)]. Rule-based, domain-detailed modeling approaches (*BioNetGen* [Faeder et al. (2009)], *Kappa* [Danos and Laneve (2004)], and *Simmune* [Angermann et al. (2012); Meier-Schellersheim et al. (2006)]) define rules for interactions between pairs of molecule domains, specifying how the interactions depend on particular states of the molecules (pattern) and their locations in specific compartments. In order to generate networks of biochemical reactions these rules are applied to the molecular components of the systems to be modeled, either at the beginning of the modeling (simulation) process or “on the fly” (as molecule complexes emerge from the interaction rules). Expressing such rule-based, domain-detailed reaction networks using the concepts of **Species** and **Compartment** in SBML (L3 core and L2) can be difficult for rules and molecule sets that lead to large numbers of resulting molecular complexes. It would therefore be desirable to have an SBML standard for encoding rule-based, domain-detailed models using their “native” concepts for describing reactions instead of having to apply the rules and unfold the networks prior to encoding in an SBML format.

We proposed a revised proposal of the Multi package: “Multistate, Multicomponent and Multicompartment Species Package for SBML Level 3” (abbreviated as Multi) [Zhang et al. (2012) and Zhang and Meier-Schellersheim (2013a)] which takes the scopes and some data structures developed in the previous Multi proposal [Le Novère and Oellrich (2010)] and addresses main issues arising from a rule-based, domain-detailed modeling point of view with the data structures consistent with that used in the available rule-based, domain-detailed modeling tools.

*Note:*

*This specification was developed with the main goal of taking into account bi-molecular interactions mediated through specific binding domains (or sites). Models without such detailed description of the molecular interactions can be encoded as well if the other features in this specification such as **SpeciesFeatureType**, **SpeciesFeature**, and extended **Compartment** satisfy the model requirements.*

### 2.1 Past work on this problem or similar topics

- Nicolas Le Novère and Anika Oellrich proposed the previous version of the Multi proposal [Le Novère and Oellrich (2010)]. However, it was realized that a more detailed treatment of molecular binding sites and their state-dependent interactions would be desirable.
- In August 2012, Fengkai Zhang from the *Simmune* group presented “Draft for discussion SBML Proposals for Revised Multi, Simple Spatial and Multi-Spatial Extensions” at COMBINE 2012 [Zhang et al. (2012)]. The three proposals cover the goals and scope of the previous Multi proposal (2010), revise it and add some new features that improve usage of the proposal for rule-based approaches.
- Based on the discussions and suggestions received during COMBINE 2012 as well as on feedback from the SBML discussion forum, the new Multi proposal [Rev 221, Zhang and Meier-Schellersheim (2012)] was released to the SBML-Multi community, which integrates and covers most of the features in the three previous proposals of August 2012.
- In May 2013, a new revision (rev 280) of the Multi proposal [Zhang and Meier-Schellersheim (2013a)] was released before the meeting of HARMONY 2013. The extended **Compartment** class and its related classes have been reorganized. All optional boolean attributes have been removed/replaced. A new optional Multi attribute, “**whichValue**”, was added to the **ci** elements in **KineticLaw** to identify the sources of **species**. (Lucian Smith gave many comments/suggestions about this proposal and William Hlavacek gave thoughtful feedback about the *BioNetGen* example in this proposal). This revision (rev 280) was presented at HARMONY 2013 [Zhang and Meier-Schellersheim (2013b)] with new features to configure multiple occurrences of **SpeciesFeatureType**. Several new or revised features were discussed during and after HARMONY 2013, including multiple occurrences of **SpeciesFeatureType**, multiple copies of **SpeciesTypeInstance**, the **numericValue** attribute for **PossibleSpeciesFeatureValue** and concentration summation of pattern **species**. These features are covered

or updated in the specifications from v1.0.1.

## 2.2 Revision history

The versioning convention used in this document:

**x.y.z (status)**

**x:** version of SBML Level 3 core.

**y:** version of the Multi package.

**z:** release of the Multi package at its version **y**.

**status:** “draft”, “release candidate”, or “release”. Absence of status means “release”.

For example, the current version is “1.1.1”

**x** = “1”

**y** = “1”

**z** = “1”

The followings are the revision history of the Multi package:

### 2.2.1 Release(s)

- **Version: 1.1.1, this version**

### 2.2.2 Release Candidates

- **Version: 1.1.rc5 (release candidate), March 2017**

- Add two validation rules [multi-21213](#) and [multi-21214](#) to check the `speciesType` attribute of a `species` with `listOfOutwardBindingSites` and/or `listOfSpeciesFeatures` (See [Section 3.15 on page 26](#).)
- Add a constraint to the `relation` attribute of a `subListOfSpeciesFeatures` having a `speciesFeature` child referencing a `speciesFeatureType` with “`occur > 1`”. (See [Section 3.17.2 on page 30](#) and [Section A on page 76](#).)
- Enforce the [SubListOfSpeciesFeatures](#) class to have at least two `speciesFeatures` and set `relation` as a required attribute. (See [Section 3.17 on page 29](#).)

- **Version: 1.1.rc4 (release candidate), March 2017**

More updates on validation rule numbers, line breaks, and the example about [SubListOfSpeciesFeatures](#).

- **Version: 1.1.rc3 (release candidate), February 2017**

Modify the numbers of several rules to be consistent with the general SBML validation rule conventions.

- **Version: 1.1.rc2 (release candidate), January 2017**

Add a new validation rule [multi-22006](#) to prevent circular referencing among the extended [Compartment](#) objects.

Revise the specification text with minor changes towards a version of the official release candidate.

- **Version: 1.1.rc1 (release candidate), November 2016**

Revise the specification text with minor changes towards a version of the official release candidate.

### 2.2.3 Drafts

- **Version: 1.0.7 (draft), August 2016**

Remove the `SpeciesFeatureChange` and `ListOfSpeciesFeatureChanges` classes under [SpeciesTypeComponent-MapInProduct](#). The relations expressed in `SpeciesFeatureChange` can be inferred from the `speciesType-ComponentMapInProduct` and the `species` of the mapped `reactant` and `product`.

Add a new validation rule 21306, “an `outwardBindingSite` cannot be a binding site in a bond of the species”

(see [Section 3.16.3 on page 28](#) and [Section A on page 77](#))

■ **Version: 1.0.6 (draft), March 2016**

Remove recursively referencing relationship in the [ListOfSpeciesFeatures](#) class and add a [SubListOfSpeciesFeatures](#) class. See the details in [Species](#).

Version 1.0.6.1 with minor document update is released in April 2016.

■ **Version 1.0.5 (draft), November 2015**

This version has been developed from the previous release v1.0.4 with the following modifications based on the discussion during and after COMBINE 2015 [[Zhang \(2015\)](#)]:

- Drop the `occur` attribute in the class of [SpeciesTypeInstance](#).
- Drop the `occur` attribute in the class of [SpeciesTypeComponentIndex](#).
- Drop the class of [DenotedSpeciesTypeComponentIndex](#).
- Revise the scope of [PossibleSpeciesFeatureValue](#) ids to be global.

Version 1.0.5.1 with minor document update is released in Dec 2015.

■ **Version 1.0.4 (draft), June 2015**

This version has been developed from the previous release v1.0.3 with minor document update and complete validation rules.

■ **Version 1.0.3 (draft), April 2015**

This version has been developed from the previous release v1.0.2 mainly based on the discussion in COMBINE 2014 with focus on how to facilitate tools to export and import models encoded in the Multi format [[Zhang and Meier-Schellersheim \(2014\)](#)]

■ **Version 1.0.2 (draft), November 2014**

This version has been developed from the previous release v1.0.1 with the following modifications:

- A new [BindingSiteSpeciesType](#) sub-class inheriting the [SpeciesType](#) class for `binding sites`. Accordingly, the `isBindingSite` attribute has been dropped from [SpeciesType](#).
- Restriction on `binding sites` which have to be atomic.
- Restriction on [SpeciesType](#) that a `speciesType` cannot have a `listOfSpeciesFeatureTypes` if it has a `listOfInSpeciesTypeBonds`.
- A new [IntraSpeciesReaction](#) sub-class inheriting the [Reaction](#) class for the reactions happening within a [Species](#) object. Accordingly, the `isIntraSpeciesReaction` attribute has been dropped from [Reaction](#).
- Validation rules.

■ **Version 1.0.1 (draft), September 2013**

This was released and presented in COMBINE 2013 [[Zhang and Meier-Schellersheim \(2013c\)](#)], mainly addressing the scenario of multiple occurrences of identical components and/or identical features.

## 2.2.4 Revision history before draft version 1.0.1

See the past work ([Section 2.1 on page 6](#)).

## 3 Package syntax and semantics

This section contains a definition of the syntax and semantics of the Multi package for SBML Level 3 Core.

### 3.1 Namespace URI and other declarations necessary for using this package

The following is the namespace URI for this version of the Multi package for SBML Level 3 Core:

```
"http://www.sbml.org/sbml/level3/version1/multi/version1"
```

In addition, SBML documents using a given package must indicate whether the package can be used to change the mathematical interpretation of a model. This is done using the attribute **required** on the `<sbml>` element in the SBML document. For the Multi package, the value of this attribute must be **"true"**.

The following fragment illustrates the beginning of a typical SBML model using SBML Level 3 Core and this version of the Multi package:

```
<?xml version="1.0" encoding="UTF-8"?>  
<sbml xmlns="http://www.sbml.org/sbml/level3/version1/core" level="3" version="1"  
  xmlns:multi="http://www.sbml.org/sbml/level3/version1/multi/version1" multi:required="true">
```

### 3.2 Primitive data types

The Multi package uses a number of the primitive data types described in [Section 3.1](#) of the SBML Level 3 Core [[Hucka et al. \(2016\)](#)] specification such as `SID`, `SIDRef`, `string`, `boolean`, `int` and `positiveInteger`, and adds three additional primitive types described below.

#### 3.2.1 Type `BindingStatus`

The `BindingStatus` primitive data type is used in the definition of the `OutwardBindingSite` class. `BindingStatus` is derived from type `string` and its values are restricted to be one of the following possibilities: **"bound"**, **"unbound"**, and **"either"**. Attributes of type `BindingStatus` cannot take on any other values. The meaning of these three values is discussed in the context of the `OutwardBindingSite` class in [Section 3.16 on page 28](#).

#### 3.2.2 Type `Relation`

The `Relation` primitive data type is used in the definition of the `SubListOfSpeciesFeatures` class. `Relation` is derived from type `string` and its values are restricted to be one of the following possibilities: **"and"**, **"or"**, and **"not"**. Attributes of type `Relation` cannot take on any other values. The meaning of these three values is discussed in the context of the `SubListOfSpeciesFeatures` class in [Section 3.17 on page 29](#).

#### 3.2.3 Type `RepresentationType`

The `RepresentationType` primitive data type is used in the extension of the `ci` element. `RepresentationType` is derived from type `string` and its values are restricted to be one of the following possibilities: **"sum"** or **"numericValue"**. If present, attributes of type `RepresentationType` cannot take on any other values. The meaning of these values is discussed in the context of the `ci` element in [Section 3.26 on page 41](#).

### 3.3 The new and extended classes in the Multi Package

The Multi package defines or extends the following object classes, `Model`, `ListOfSpeciesTypes`, `Compartment`, `ListOfCompartmentReferences`, `CompartmentReference`, `SpeciesType`, `ListOfSpeciesTypeInstances`, `ListOfSpeciesFeatureTypes`, `ListOfInSpeciesTypeBonds`, `ListOfSpeciesTypeComponentIndexes`, `SpeciesFeatureType`, `ListOfPossibleSpeciesFeatureValues`, `PossibleSpeciesFeatureValue`, `SpeciesTypeInstance`, `InSpeciesType`

**Bond, SpeciesTypeComponentIndex, Species, ListOfOutwardBindingSites, ListOfSpeciesFeatures, SubListOfSpeciesFeatures, OutwardBindingSite, SpeciesFeature, ListOfSpeciesFeatureValues, SpeciesFeatureValue, Reaction, SimpleSpeciesReference, SpeciesReference, ListOfSpeciesTypeComponentMaps-InProduct, and SpeciesTypeComponentMapInProduct.**

All the classes in the Multi package are directly or indirectly derived from **SBase**, and **SBase** provides the ability to attach SBO terms as well as MIRIAM annotations. The semantics of a given class in the Multi package can be made more precise by referencing to external controlled vocabularies and ontologies.

Like the classes in SBML Level 3 Core, most new Multi classes have the attribute **id** (typically mandatory but not all, and of type **SId**), which serves as an identifier to provide a way to identify the class object. The identifier of a class object reference may or may not carry mathematical interpretation or be used in mathematical formulas, depending on its class and the class object referencing it. The scope of **ids** is described in the section of “Namespace scoping rules for identifiers” ([Section 3.27 on page 43](#)).

## 3.4 Model

The Multi package extends the **Model** class of SBML Level 3 Core and adds an optional **ListOfSpeciesTypes** child to **Model**. Figure 1 provides the UML diagram for the extended **Model** class.

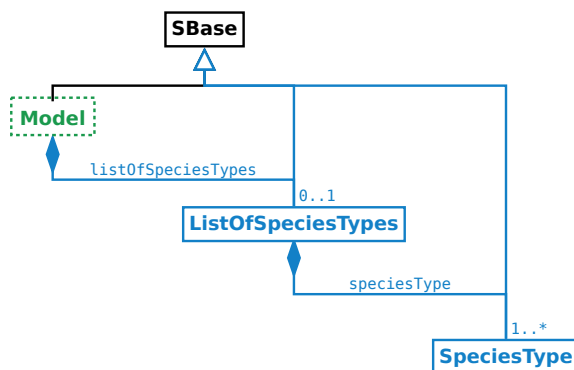

Figure 1: The extension of the **Model** class.

### 3.4.1 ListOfSpeciesTypes

**ListOfSpeciesTypes** is defined in Figure 1. If present, a **ListOfSpeciesTypes** object must contain at least one **SpeciesType** object. Since **ListOfSpeciesTypes** is derived from **SBBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

## 3.5 Extended **Compartment**

A **Compartment** object in SBML Level 3 Core represents a bounded space in which *species* are located. In the Multi package, **Compartment** is extended. A Multi **compartment** can be a **type** that multiple referencing **compartment**s can map to. A Multi **compartment** can also be a composite **compartment** or a container that includes other **compartment**s.

The extension of **Compartment** is defined in Figure 2. The extended **Compartment** class has a new required attribute **isType**, a new optional attribute **compartmentType** and an optional **ListOfCompartmentReferences** child. The example at Section 4.1 on page 44 illustrates the use of the extended **Compartment** class.

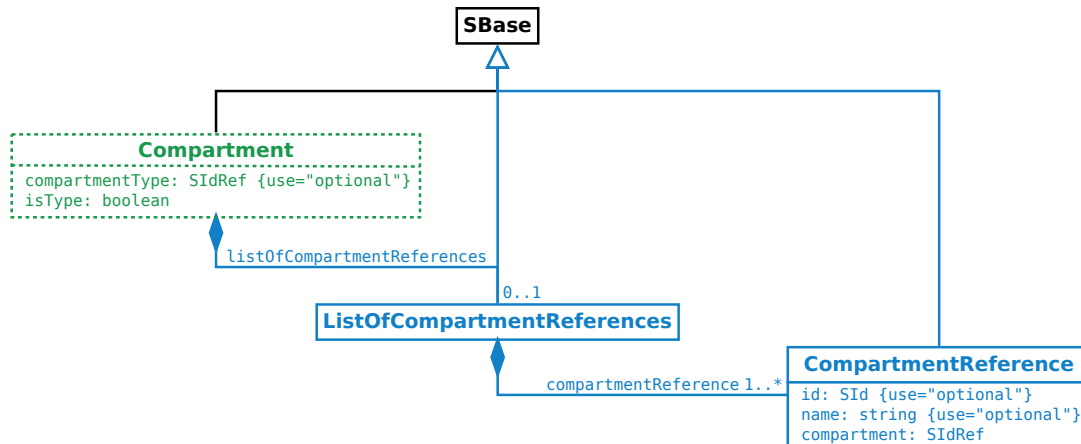

Figure 2: The definitions of **Compartment**, **ListOfCompartmentReferences** and **CompartmentReference**

### 3.5.1 The **isType** attribute

The required attribute **isType**, of type **boolean**, on the **Compartment** class serves to provide a way to indicate whether the **Compartment** object is a compartment type.

A **Compartment** object is a compartment type if the value of its **isType** attribute is “**true**”. A **compartment type** is a template (in the sense of prototype) for all **Compartment** objects referencing it (via **compartmentType** attributes). A **Species** object directly referencing a compartment type is not a *fully defined species* (see Section 3.19 on page 34).

If the value of the **isType** attribute is “**false**”, the **Compartment** object is a “**not-a-type**” *compartment*, and it is similar to a SBML core **compartment** except it can reference a compartment type and can have a **ListOfCompartmentReferences** child.

### 3.5.2 The **compartmentType** attribute

The optional attribute **compartmentType**, of type **SIdRef**, is used for a “**not-a-type**” **compartment** to reference a compartment type. A **compartment** with the “**true**” value of its **isType** attribute cannot have the **compartmentType** attribute defined.

### 3.5.3 **ListOfCompartmentReferences**

**ListOfCompartmentReferences** is defined in Figure 2, and is extended from the **ListOf** class. A **listOfCompartmentReferences** must have one or more **CompartmentReference** children. Since **ListOfCompartmentReferences** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

## 3.6 `CompartmentReference`

`CompartmentReference` is defined in [Figure 2 on the preceding page](#). It has two optional attributes `id` and `name`, and a required attribute `compartment`. Since `CompartmentReference` is derived from `SBase`, it inherits the `sboTerm` and `metaid` attributes, as well as the optional children `Notes` and `Annotation` objects.

### 3.6.1 *The id and name attributes*

The optional `id` attribute, of type `SId`, serves to provide a way to identify a `compartmentReference`. `CompartmentReference` also has an optional `name` attribute of type `string`.

If some or all `compartmentReferences` within a `ListOfCompartmentReferences` object reference the same `compartment`, those `compartmentReferences` are required to have their `id` attributes defined to distinguish them.

### 3.6.2 *The compartment attribute*

The required `compartment` attribute, of type `SIdRef`, serves to provide a way to reference a `Compartment` object.

*Note:*

*A `compartmentReference` cannot reference a `compartment` that directly or indirectly contains the `compartmentReference`. In other words, circular references are not allowed when constructing `compartments` and `compartmentReferences`.*

## 3.7 The relationship of `Compartment`, `CompartmentReference` and `ListOfCompartmentReferences`

In a `ListOfCompartmentReferences` object, every children `compartmentReferences` must exclusively reference, directly or indirectly, “not-a-type” `compartment` which can be of the same `compartment` type. See the extended `Compartment` objects in the example in [Section 4.1 on page 44](#).

All `compartments` referenced by a `listOfCompartmentReferences` must have the values of their `isType` attributes the same as that in the parent `compartment` of the `listOfCompartmentReferences`. For example, a `compartment` “A” with `isType=“true”` has a `listOfCompartmentReferences` referencing two `compartments` “A1” and “A2”. Then, “A1” and “A2” must have `isType=“true”`.

## 3.8 SpeciesType

**SpeciesType** is defined in [Figure 3](#) and serves to provide backbone structures for **species**. **SpeciesType** has one required attribute, **id**, two optional attributes, **name** and **compartment** and four optional **ListOf\_\_** objects of **ListOfSpeciesFeatureTypes**, **ListOfSpeciesTypeInstances**, **ListOfInSpeciesTypeBonds** and **ListOfSpeciesTypeComponentIndexes** respectively. Since **SpeciesType** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

The **ListOfSpeciesTypeInstances** subobject provides a way to define multicomponents which are instances of other **SpeciesType** objects.

The **ListOfSpeciesFeatureTypes** subobject and its **SpeciesFeatureType** children set up a framework for the referencing **species** or the instances of **speciesTypes** to be able to have multistates. The **ListOfSpeciesTypeComponentIndexes** subobject provides a flexible way to reference any **component** in a **speciesType**.

Figure 3: The definition of the **SpeciesType** class.

### 3.8.1 The id and name attributes

The required **id** attribute, of type **SId**, serves to provide a way to identify a **speciesType**. **SpeciesType** also has an optional **name** attribute of type **string**.

### 3.8.2 The compartment attribute

**SpeciesType** has an optional attribute **compartment**, of type **SIdRef**, to be used to identify the **compartment** where the **speciesType** is located. The attribute value must be the identifier of an existing **compartment** in the **model**. If present, it must be consistent with the **compartment** attributes of the referencing **species** (see [Section 3.15 on page 26](#)) and the **compartmentReference** attributes of its instances (see [Section 3.11.3 on page 18](#)). The example in [Section 4.1 on page 44](#) illustrates how to keep the consistency of this attribute.

### 3.8.3 ListOfSpeciesFeatureTypes

**ListOfSpeciesFeatureTypes** is defined in [Figure 3 on the preceding page](#), and is extended from the **ListOf** class. If present, a **listOfSpeciesFeatureTypes** must have one or more **SpeciesFeatureType** children. Since **ListOfSpeciesFeatureTypes** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.8.4 ListOfSpeciesTypeInstances

**ListOfSpeciesTypeInstances** is defined in [Figure 3 on the previous page](#), and is extended from the **ListOf** class. If present, a **listOfSpeciesTypeInstances** must have one or more **SpeciesTypeInstance** children. Since **ListOfSpeciesTypeInstances** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.8.5 ListOfInSpeciesTypeBonds

**ListOfInSpeciesTypeBonds** class is defined in [Figure 3 on the preceding page](#), and is extended from the **ListOf** class. If present, a **listOfInSpeciesTypeBonds** must have one or more **InSpeciesTypeBond** children. Since **ListOfInSpeciesTypeBonds** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.8.6 ListOfSpeciesTypeComponentIndexes

**ListOfSpeciesTypeComponentIndexes** is defined in [Figure 3 on the previous page](#), and is extended from the **ListOf** class. If present, a **listOfSpeciesTypeComponentIndexes** must have one or more **SpeciesTypeComponentIndex** children. Since **ListOfSpeciesTypeComponentIndexes** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.8.7 BindingSiteSpeciesType

**BindingSiteSpeciesType** inherits the **SpeciesType** class and is defined in [Figure 3 on the preceding page](#). A **BindingSiteSpeciesType** object is a **binding site**, and therefore its instance can further define the **bindingStatus** attribute and can participate a binding internally and explicitly in an **InSpeciesTypeBond** object, or externally and implicitly defined by an **OutwardBindingSite** object. A **binding site** must be an atomic component which means that a **BindingSiteSpeciesType** object cannot contain a **ListOfSpeciesTypeInstances** subobject.

*Note:*

*In the Multi package, a binding site can only participate in one binding at a time. That means a binding site cannot bind two partners at the same time. The binding relationship is one-to-one.*

## 3.9 SpeciesFeatureType

**SpeciesFeatureType** is defined in Figure 4, and serves to provide frameworks or templates to define the referencing **SpeciesFeature** objects. **SpeciesFeatureType** has two required attributes **id** and **occur**, an optional attribute **name**, and a required child **listOfPossibleSpeciesFeatureValues**. The multiple possibleSpeciesFeatureValues of the **ListOfPossibleSpeciesFeatureValues** object permit constructing multistate species via its speciesFeatures under the **ListOfSpeciesFeatures** or **SubListOfSpeciesFeatures** object. Since **SpeciesFeatureType** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

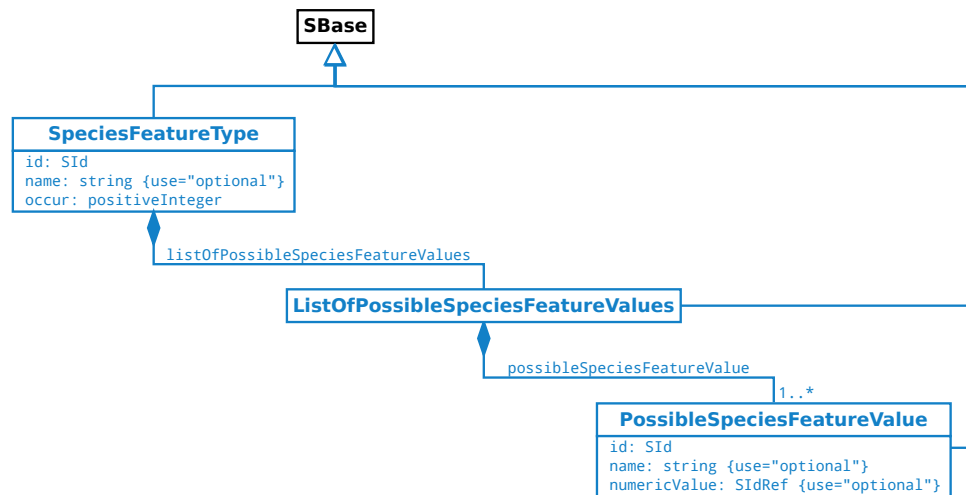

Figure 4: The definitions of **SpeciesFeatureType**, **ListOfPossibleSpeciesFeatureValues** and **PossibleSpeciesFeatureValue** classes.

### 3.9.1 The id and name attributes

The required **id** attribute, of type **SId**, serves to provide a way to identify a **speciesFeatureType**. Its value must be unique within its direct parent **speciesType**. When a **speciesFeatureType** is referenced by a **speciesFeature**, a **SpeciesTypeComponentIndex** object indexing the containing **component** can be used to avoid ambiguity.

**SpeciesFeatureType** also has an optional **name** attribute of type **string**.

### 3.9.2 The occur attribute

**SpeciesFeatureType** has a required attribute **occur**, of type **positiveInteger**, used to indicate the number of instances of the **speciesFeatureType**. This attribute can be used to infer the number of the instances in *don't care* state with the use of the **occur** attribute in a referencing **speciesFeature** (also see Section 3.18.3 on page 31).

### 3.9.3 ListOfPossibleSpeciesFeatureValues

**ListOfPossibleSpeciesFeatureValues** is defined in Figure 4, and is extended from the **ListOf** class. A **listOfPossibleSpeciesFeatureValues** must have one or more **PossibleSpeciesFeatureValue** children. Since **ListOfPossibleSpeciesFeatureValues** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

## 3.10 PossibleSpeciesFeatureValue

**PossibleSpeciesFeatureValue** is defined in [Figure 4 on the preceding page](#), and is used to define the possible values a **speciesFeature** can take. It has a required attribute **id** and two optional attributes **name** and **numericValue**. Since **PossibleSpeciesFeatureValue** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.10.1 The id and name attributes

The required **id** attribute, of type **SIId**, serves to provide a way to identify a **possibleSpeciesFeatureValue**.

If the **id** of a **possibleSpeciesFeatureValue** is the content of a **ci** element in a MathML expression, it can either represent the **numericValue** ( when the **ci** has **representationType**="numericValue") or the count of the feature instances (default) which have this value.

**PossibleSpeciesFeatureValue** also has an optional **name** attribute of type **string**.

### 3.10.2 The numericValue attribute

**PossibleSpeciesFeatureValue** has an optional attribute **numericValue** to be used to provide a reference to a numeric value that the **PossibleSpeciesFeatureValue** object can have. This attribute has type of **SIIdRef**, and the value must be the identifier of a **Parameter** object in the **model**. The numeric value along with the unit can be defined in the **Parameter** object.

The modeler can either use the identifier of the **parameter**, or the identifier of the **possibleSpeciesFeatureValue** (with **ci**'s **representationType** and **speciesReference** attribute) as the content of a **ci** element to represent its value in MathML expressions in SBML.

## 3.11 SpeciesTypeInstance

**SpeciesTypeInstance** serves to provide a way to construct **speciesTypes** and **species** with multiple components. A **speciesType** can contain a list of instances of other **speciesTypes** which can also have their own **speciesTypeInstances**, so the complete construct of a **speciesType** has a tree structure. A **speciesType** cannot contain an instance of any other **speciesType** that already contains the instance of it. In other words, circular references are not allowed when constructing **speciesTypes**. For example, if a **speciesType** “A” contains the instance of another **speciesType** “B”, “B” must not contain the instance of “A” anywhere in the complete structure of “B”.

**SpeciesTypeInstance** is defined in Figure 5. It has two required attributes, **id**, and **speciesType**, and two optional attributes **name** and **compartmentReference**. Since **SpeciesTypeInstance** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

Figure 5: The definition of the **SpeciesTypeInstance** class

### 3.11.1 The id and name attributes

The required attribute **id**, of type **SId**, serves to provide a way to identify a **speciesTypeInstance**. Its value must be unique within its direct parent **speciesType**.

**SpeciesTypeInstance** also has an optional **name** attribute of type **string**.

### 3.11.2 The speciesType attribute

The required attribute **speciesType**, of type **SIdRef**, is used to reference a **speciesType**.

### 3.11.3 The compartmentReference attribute

The optional attribute **compartmentReference**, of type **SIdRef**, can be used to indicate which sub-compartment in a composite **compartment** the **speciesTypeInstance** is located in.

For example, a compartment “cA” has two sub-compartments “cB1” (referenced by **compartmentReference** “crB1”) and “cB2” (referenced by **compartmentReference** “crB2”) of the same compartment type “cB”. A **speciesType** “stA” has two **speciesTypeInstances** “stiB1” and “stiB2” of the same **speciesType** “stB”. The **speciesType** “stA” references the compartment “cA” and the **speciesType** “stB” references the compartment “cB”. The **speciesTypeInstance** “stiB1” is located in “cB1” via the **compartmentReference** “crB1” and the **speciesTypeInstance** “stiB2” is located in “cB2” via the **compartmentReference** “crB2”. The SBML code can be as follows:

```

<listOfCompartments>
  <compartment id="cB" multi:isType="true" ... />
  <compartment id="cB1" multi:isType="false" multi:compartmentType="cB" ... />
  <compartment id="cB2" multi:isType="false" multi:compartmentType="cB" ... />
  <compartment id="cA" multi:isType="false" ... >
    <multi:listOfCompartmentReferences>
      <multi:compartmentReference multi:id="crB1" multi:compartment="cB1" />
      <multi:compartmentReference multi:id="crB2" multi:compartment="cB2" />
    </multi:listOfCompartmentReferences>
  </compartment>

```

```
</listOfCompartments>
<multi:listOfSpeciesTypes>
  <multi:speciesType multi:id="stB" multi:compartment="cB" ... />
  <multi:speciesType multi:id="stA" multi:compartment="cA" ... >
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="stiB1" multi:speciesType="stB"
        multi:compartmentReference="crB1" ... />
      <multi:speciesTypeInstance multi:id="stiB2" multi:speciesType="stB"
        multi:compartmentReference="crB2" ... />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
</multi:listOfSpeciesTypes>
```

## 3.12 SpeciesTypeComponentIndex

**SpeciesTypeComponentIndex** provides a way to identify or index a **component** within a **speciesType**. A **SpeciesTypeComponentIndex** object can be referenced by other class objects, such as **InSpeciesTypeBond**, **OutwardBindingSite**, **SpeciesFeature** or **SpeciesTypeComponentMapInProduct** objects, which needs to identify a component in a particular **speciesType**.

**SpeciesTypeComponentIndex** is defined in Figure 6. It has two required attributes, **id**, and **component**, and two optional attributes **name** and **identifyingParent**. Since **SpeciesTypeComponentIndex** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

Figure 6: The definition of the **SpeciesTypeComponentIndex** class

See Section 3.16.3 on page 28 about how to use **SpeciesTypeComponentIndex** in an **outwardBindingSite**.

*Note:*

A **speciesTypeComponentIndex** should be unambiguous. For example, a **speciesTypeComponentIndex** should not reference to a **speciesType** which is referenced by two **speciesTypeInstances** contained in the same **SpeciesType** object.

### 3.12.1 The id and name attributes

The **id** attribute, of type **SId**, provides a way to identify a **speciesTypeComponentIndex**. The value must be unique within the direct parent **speciesType**. **SpeciesTypeComponentIndex** also has an optional **name** attribute of type **string**.

### 3.12.2 The component attribute

The **component** attribute, of type of **SIdRef**, references a **speciesTypeInstance** in the **speciesType**, or the **speciesType** itself. The value of this attribute can be the **id** of a **speciesTypeInstance** or a **speciesTypeComponentIndex** that is defined in the **speciesType** of a **speciesTypeInstance**.

### 3.12.3 The identifyingParent attribute

The **component** attribute itself may not be sufficient to uniquely reference a component in a **speciesType**. The **identifyingParent** attribute provides assistance for the identification of a **component**. It references a parent of the component and the value can be the **id** of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType**.

This example illustrates the use of the **identifyingParent** attribute. There are three **speciesTypes** “**stA**”, “**stB**” and “**stC**”. The **speciesType** “**stB**” contains two **speciesTypeInstances** “**C1**” and “**C2**” of the same **speciesType** “**stC**”. The **speciesType** “**stA**” contains two **speciesTypeInstances** “**B1**” and “**B2**” of the same **speciesType** “**stB**”. The **speciesType** “**A**” may be required to index every “**C1**” and “**C2**” by its **ListOfInSpeciesTypeBonds** child or referencing **species**. The following SBML code demonstrates how to do the indexing with assistance from the **identifyingParent** attribute.

```

<multi:listOfSpeciesTypes>
  <multi:speciesType multi:id="stC" ... />
  <multi:speciesType multi:id="stB" ... >
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="C1" multi:speciesType="stC" />
      <multi:speciesTypeInstance multi:id="C2" multi:speciesType="stC" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="stA" ... >
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="B1" multi:speciesType="stB" />
      <multi:speciesTypeInstance multi:id="B2" multi:speciesType="stB" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfSpeciesTypeComponentIndexes>
      <multi:speciesTypeComponentIndex multi:id="B1C1"
        multi:component="C1" multi:identifyingParent="B1" />
      <multi:speciesTypeComponentIndex multi:id="B1C2"
        multi:component="C2" multi:identifyingParent="B1" />
      <multi:speciesTypeComponentIndex multi:id="B2C1"
        multi:component="C1" multi:identifyingParent="B2" />
      <multi:speciesTypeComponentIndex multi:id="B2C2"
        multi:component="C2" multi:identifyingParent="B2" />
    </multi:listOfSpeciesTypeComponentIndexes>
    ...
  </multi:speciesType>
  ...
</multi:listOfSpeciesTypes>

```

In the speciesType “stA”, “B1C1” identifies the “C1” in “B1” and “B2C1” identifies the “C1” in “B2”. Similarly, “B1C2” identifies the “C2” in “B1” and “B2C2” identifies “C2” in “B2”.

### 3.12.4 Reference a component in a speciesType or a species

In the Multi package, component(s) of a speciesType (or a species via its speciesType attribute) can be referenced by objects of multiple classes such as [OutwardBindingSite](#) and [SpeciesFeature](#). A component of a speciesType can be a speciesTypeInstance or the speciesType itself. For example:

```

<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="stA" ... />
  <multi:speciesType multi:id="stB" ...>
    ...
  </multi:speciesType>
  <multi:speciesType multi:id="stABB" ...>
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="stiA" multi:speciesType="stA" .../>
      <multi:speciesTypeInstance multi:id="stiB1" multi:speciesType="stB" .../>
      <multi:speciesTypeInstance multi:id="stiB2" multi:speciesType="stB" .../>
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
</multi:listOfSpeciesTypes>
<listOfSpecies>
  <species id="spA" multi:speciesType="stA" ...>
    <multi:listOfOutwardBindingSites>
      <multi:outWardBindingSite multi:component="stA" multi:bindingStatus="bound" />
    </multi:listOfOutwardBindingSites>
  </species>
  <species id="spABB" multi:speciesType="stABB" ...>
    <multi:listOfOutwardBindingSites>
      <multi:outWardBindingSite multi:component="stiA" multi:bindingStatus="bound" />
    </multi:listOfOutwardBindingSites>
    ...
  </species>
</listOfSpecies>

```

In this example, the `component` of the `outwardBindingSite` in species “`spABB`” is a `speciesTypeInstance` (“`spABB`”),  
and the `component` of the `outwardBindingSite` in species “`spA`” is a `speciesType` (“`stA`”) which is directly refer-  
enced by the `speciesType` attribute of “`spA`”.

In many cases, to reference a component, the `id` of the `component` will be sufficient and it is not necessary to create  
an index (`speciesTypeComponentIndex`). The example in [Section 3.12.3 on page 20](#) illustrates two equivalent ways  
to reference a component, for example, the “`B1`” component in the “`stA`” `speciesType`. The creation of a `species-`  
`TypeComponentIndex` cannot be avoided when a `speciesType` (indirectly) has two `speciesTypeInstances` that  
have the same `id`.

### 3.13 InSpeciesTypeBond

An **InSpeciesTypeBond** object defines a bond existing within a **speciesType**. The bond therefore exists in every **species** that references the **speciesType**.

**InSpeciesTypeBond** is defined in [Figure 7](#). It has two optional attributes, **id** and **name**, and two required attributes, **bindingSite1** and **bindingSite2**. Since **InSpeciesTypeBond** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

The binding relationship in an **inSpeciesTypeBond** is one-to-one (see [Section 3.8.7 on page 15](#)). The uniqueness of an **inSpeciesTypeBond** is ensured by the pair of referenced **bindingSites**. A **speciesType** cannot have two **inSpeciesTypeBonds** containing the same pair of **bindingSites**.

*Figure 7: The definition of the **InSpeciesTypeBond** class*

#### 3.13.1 The **id** and **name** attributes

The optional **id** attribute, of type **SId**, provides a way to identify an **inSpeciesTypeBond**. If present, the value of the **id** attribute must be unique within its direct parent **speciesType**.

**InSpeciesTypeBond** also has an optional **name** attribute of type **string**.

#### 3.13.2 The **bindingSite1** and **bindingSite2** attributes

**InSpeciesTypeBond** has two required attributes, **bindingSite1** and **bindingSite2**, both of type **SIdRef**, used to reference a pair of binding sites of the **InSpeciesTypeBond** object in a **speciesType**. The referenced identifiers of the binding sites can be the **ids** of the **speciesTypeInstances** (binding sites), or the **ids** of the **speciesTypeComponent-Indexes** indexing the binding sites and the ultimately referenced components must be the **BindingSiteSpeciesType** objects. Obviously, **bindingSite1** and **bindingSite2** must not reference the same **BindingSiteSpeciesType** object.

### 3.14 Uniqueness of **SpeciesType** definitions

In some special cases, it may be possible to define a **speciesType** in multiple equivalent ways.

Figure 8 shows an example of a **speciesType** constructed in two different ways. The two “**st\_x**” **speciesTypes** in the diagram can be the results of different reaction paths, but they are equivalent and define the same **speciesType**.

Figure 8: Different formats of the same **speciesType**

Construct 1: The definition of **speciesType** “**st\_x**” on the left (A) in Figure 8.

```

<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="st1" />
  <multi:bindingSiteSpeciesType multi:id="st2" />
  <multi:bindingSiteSpeciesType multi:id="st3" />
  <multi:bindingSiteSpeciesType multi:id="st4" />
  <multi:speciesType multi:id="st_a">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_1" multi:speciesType="st1" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_b">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_2" multi:speciesType="st2" />
      <multi:speciesTypeInstance multi:id="_3" multi:speciesType="st3" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_c">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_4" multi:speciesType="st4" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_t">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="sti_a" multi:speciesType="st_a" />
      <multi:speciesTypeInstance multi:id="sti_b" multi:speciesType="st_b" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="_1" multi:bindingSite2="_2" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
  <multi:speciesType multi:id="st_x">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="sti_t" multi:speciesType="st_t" />
      <multi:speciesTypeInstance multi:id="sti_c" multi:speciesType="st_c" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="_3" multi:bindingSite2="_4" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>

```

```
</multi:listOfSpeciesTypes>
```

Construct 2: The definition of speciesType “st\_x” on the right (B) in [Figure 8 on the previous page](#).

```
<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="st1" />
  <multi:bindingSiteSpeciesType multi:id="st2" />
  <multi:bindingSiteSpeciesType multi:id="st3" />
  <multi:bindingSiteSpeciesType multi:id="st4" />
  <multi:speciesType multi:id="st_a">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_1" multi:speciesType="st1" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_b">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_2" multi:speciesType="st2" />
      <multi:speciesTypeInstance multi:id="_3" multi:speciesType="st3" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_c">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_4" multi:speciesType="st4" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_t">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="sti_b" multi:speciesType="st_b" />
      <multi:speciesTypeInstance multi:id="sti_c" multi:speciesType="st_c" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="_3" multi:bindingSite2="_4" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
  <multi:speciesType multi:id="st_x">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="sti_a" multi:speciesType="st_a" />
      <multi:speciesTypeInstance multi:id="sti_t" multi:speciesType="st_t" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="_1" multi:bindingSite2="_2" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
</multi:listOfSpeciesTypes>
```

This kind of ambiguity cannot be avoided for **speciesTypes** involving more than two subcomponents connected by **inSpeciesTypeBonds**. A and B in [Figure 8 on the preceding page](#) can be products of different association reactions. It is up to the modeler (parser) to identify whether the two **speciesTypes** such as those in the example above are identical.

## 3.15 Species

A **species** in SBML Level 3 Core refers to a pool of entities. A **species** in the Multi package is extended from a pool to a template or pattern to which multiple pools may map. An extended **species** can reference a **speciesType** that provides the backbone for the **species** such as **components** (including **binding sites**) and **speciesFeatureTypes**. When referencing a **speciesType**, a **species** can be further defined with regard to the binding statuses of its **outwardBindingSites** and the **speciesFeatures**. With the options to have variable values selected, such as “**either**” for the **bindingStatus** attribute and multiple **possibleSpeciesFeatureValues** for a **speciesFeature**, an extended **species** can work as a template or pattern how **species** participate in **reactions**.

The extension of the **Species** class is illustrated in Figure 9. The extended **Species** class has a new optional attribute **speciesType**, and two extra optional **ListOfOutwardBindingSites** and **ListOfSpeciesFeatures** children. A **species** may have a **listOfOutwardBindingSites** child and/or a **listOfSpeciesFeatures** child only when its **speciesType** attribute has been defined. A **species** must have its **speciesType** attribute defined when it has a **listOfOutwardBindingSites** and/or a **listOfSpeciesFeatures**. The relationship among the elements of a **listOfOutwardBindingSites** or a **listOfSpeciesFeatures** is “and”.

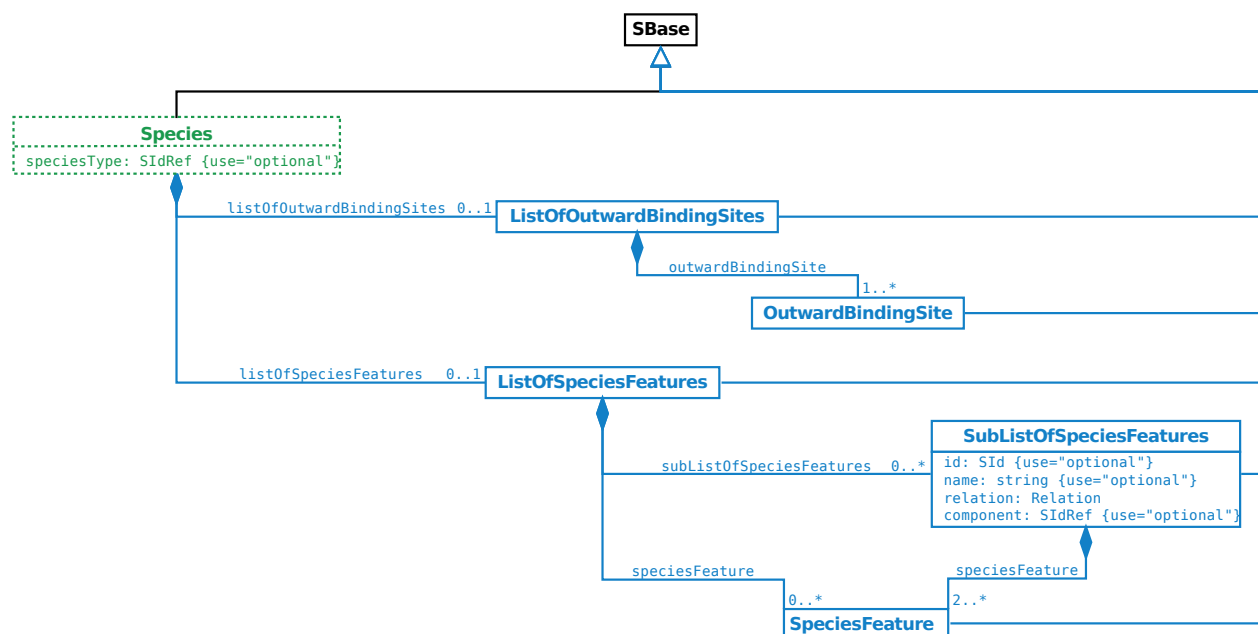

Figure 9: The extension of the **Species** class

### 3.15.1 The speciesType attribute

The optional attribute **speciesType**, of type **SIdRef**, references a **SpeciesType** object.

### 3.15.2 ListOfOutwardBindingSites

**ListOfOutwardBindingSites** is defined in Figure 9 and is extended from the **ListOf** class. A **listOfOutwardBindingSites** can only be defined when the **speciesType** attribute is defined. If present, it must have one or more **OutwardBindingSite** children. Since **ListOfOutwardBindingSites** is derived from **SBBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

 Note:

The **listOfOutwardBindingSites** of a **species** is not necessary to list all the **outwardBindingSites** (the binding

sites not involved in any `inSpeciesTypeBond`) defined by the referenced `speciesType`. If an `outwardBindingSite` is not listed in the `listOfOutwardBindingSites`, the value of its `bindingStatus` is “either”. In other words, the binding site is in a don't care state.

### 3.15.3 ListOfSpeciesFeatures

**ListOfSpeciesFeatures** is defined in [Figure 9 on the previous page](#) and is extended from the **ListOf** class. A `listOfSpeciesFeatures` can only be defined when the `speciesType` attribute is defined. If present, it must have one or more children. A child can be a **SpeciesFeature**, or a **SubListOfSpeciesFeatures** object.

 *Note:*

*The `listOfSpeciesFeatures` of a species does not have to cover all the `speciesFeatures` corresponding to all `speciesFeatureTypes` (see [Section 3.9 on page 16](#)) of every component defined by the referenced `speciesType`. If a `speciesFeatureType` is defined and there is no `speciesFeature` explicitly referencing it, the species has an implicit `speciesFeature` having all the `listOfPossibleSpeciesFeatureValues` and “or” relationships between them. In other words, the implicit `speciesFeature` has a don't care state for the species.*

Since **ListOfSpeciesFeatures** is derived from **SBase** through **ListOf**, it inherits the `sboTerm` and `metaid` attributes, as well as the optional children **Notes** and **Annotation** objects.

The example at [Section 3.18.7 on page 31](#) illustrates the usage of the **ListOfSpeciesFeatures** class.

## 3.16 OutwardBindingSite

**OutwardBindingSite** is defined in Figure 10. It has two optional attributes, **id** and **name**, and two required attributes, **bindingStatus** and **component**. A binding site not involved in any **InSpeciesTypeBond** object in the **speciesType** referenced by a **species** is an **outwardBindingSite**. Since **OutwardBindingSite** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

Figure 10: The definition of the **OutwardBindingSite** class

### 3.16.1 The id and name attributes

The optional **id** attribute, of type **SId**, can serve to provide a way to identify an **outwardBindingSite**. If present, the value must be unique within the **species**. **OutwardBindingSite** also has an optional **name** attribute of type **string**.

### 3.16.2 The bindingStatus attribute

The **bindingStatus** attribute takes a value of type **BindingStatus**.

### 3.16.3 The component attribute

The **component** attribute, of type **SIdRef**, references a **component** which ultimately reference a **BindingSiteSpeciesType** object. The attribute value must be the identifier of a **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType** object. An **outwardBindingSite** cannot be a binding site referenced by any **InSpeciesTypeBond** in the **species**.

There are three scenarios for the **component** attribute to have the value of an identifier of **SpeciesType**, **SpeciesTypeInstance**, or **SpeciesTypeComponentIndex** respectively.

- (1) When a **species** references a simple **bindingSiteSpeciesType**, the value of the **component** attribute of the **outwardBindingSite** of the **species** can only be the **id** of the referenced **speciesType**.
- (2) When a **species** references a **speciesType** with a **speciesTypeInstance** being a binding site (have an **id** of **BindingSiteSpeciesType** as its **speciesType** attribute) and the **id** of the **speciesTypeInstance** can identify the binding site within the **speciesType** (referenced by the **species**) unambiguously, and therefore, the value of the **component** attribute of an **outwardBindingSite** of the **species** can be the **id** of the **speciesTypeInstance**.
- (3) When a **species** references a **speciesType** with a **speciesTypeInstance** being a binding site (directly or indirectly) and **id** of the **speciesTypeInstance** can NOT identify the binding site without ambiguity, an **id** of **SpeciesTypeComponentIndex** can be used as the value of the **component** attribute of an **outwardBindingSite** of the **species**.

### 3.16.4 Example

Figure 11 on the next page illustrates the usage of the **OutwardBindingSite** class. **Species** “**sp\_x**” references **speciesType** “**st\_x**”, which has three **speciesTypeInstances** “**sti\_a**”, “**sti\_b**” and “**sti\_c**”. **SpeciesTypeInstance** “**sti\_a**” has **bindingSites** “**\_1**” and “**\_3**”, **speciesTypeInstance** “**sti\_b**” has **bindingSites** “**\_2**” and “**\_4**”, and **speciesTypeInstance** “**sti\_c**” has **bindingSite** “**\_5**”. The **InSpeciesTypeBond** in “**st\_x**” involves two

Figure 11: An example of [OutwardBindingSite](#)

bindingSites “\_1” and “\_2”. The other three bindingSites, “\_3”, “\_4” and “\_5”, in the species “sp\_x” are outwardBindingSites. The outwardBindingSite “\_3” is “bound” (filled circle with solid line in the diagram), the outwardBindingSite “\_4” is “unbound” (empty circle with solid line) and the outwardBindingSite “\_5” has binding status “either” (empty circle with dotted line). The corresponding SBML code would be as follows:

```

<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="st_1" />
  <multi:bindingSiteSpeciesType multi:id="st_2" />
  <multi:bindingSiteSpeciesType multi:id="st_3" />
  <multi:bindingSiteSpeciesType multi:id="st_4" />
  <multi:bindingSiteSpeciesType multi:id="st_5" />
  <multi:speciesType multi:id="st_a">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_1" multi:speciesType="st_1" />
      <multi:speciesTypeInstance multi:id="_3" multi:speciesType="st_3" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_b">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_2" multi:speciesType="st_2" />
      <multi:speciesTypeInstance multi:id="_4" multi:speciesType="st_4" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_c">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="_5" multi:speciesType="st_5" />
    </multi:listOfSpeciesTypeInstances>
  </multi:speciesType>
  <multi:speciesType multi:id="st_x">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="sti_a" multi:speciesType="st_a" />
      <multi:speciesTypeInstance multi:id="sti_b" multi:speciesType="st_b" />
      <multi:speciesTypeInstance multi:id="sti_c" multi:speciesType="st_c" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="_1" multi:bindingSite2="_2" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
</multi:listOfSpeciesTypes>
<listOfSpecies>
  <species id="sp_x" multi:speciesType="st_x">
    <multi:listOfOutwardBindingSites>
      <multi:outwardBindingSite multi:component="_3" multi:bindingStatus="bound" />
      <multi:outwardBindingSite multi:component="_4" multi:bindingStatus="unbound" />
      <multi:outwardBindingSite multi:component="_5" multi:bindingStatus="either" />
    </multi:listOfOutwardBindingSites>
  </species>
</listOfSpecies>

```

### 3.17 SubListOfSpeciesFeatures

[SubListOfSpeciesFeatures](#) is defined in [Figure 9](#) on page 26, and is extended from the [ListOf](#) class. If present, a [subListOfSpeciesFeatures](#) must have two or more [SpeciesFeature](#) children. Since [SubListOfSpeciesFeatures](#) is

derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.17.1 The id and name attributes

The optional **id** attribute, of type **SId**, can serve to provide a way to identify a **subListOfSpeciesFeatures**. If present, the value must be unique within the **species**. **SubListOfSpeciesFeatures** also has an optional **name** attribute of type **string**.

### 3.17.2 The relation attribute

**SubListOfSpeciesFeatures** has a required attribute **relation**, of type **Relation**, to define the logic relationship among its children. If any **speciesFeature** involved in a **subListOfSpeciesFeatures** references a **speciesFeatureType** with “**occur** > 1”, the **subListOfSpeciesFeatures** can only have the value “**and**” for its **relation** attribute.

### 3.17.3 The component attribute

The optional **component** attribute, of type **SIdRef**, can be used to indicate which **component** of a **species** the **subListOfSpeciesFeatures** belongs to. It is required when the **component** of any **speciesFeature** contained in this **subListOfSpeciesFeatures** cannot be identified only based on its **speciesFeatureType** attribute.

## 3.18 SpeciesFeature

**SpeciesFeature** is defined in Figure 12. It has three optional attributes, **id**, **name** and **component**, and two required attributes, **speciesFeatureType** and **occur**, and a required child **listOfSpeciesFeatureValues**. Since **SpeciesFeature** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects. **SpeciesFeature** serves to define the state of a **component** in a **species** by selecting values from the **listOfPossibleSpeciesFeatureValues** of the referenced **speciesFeatureType**.

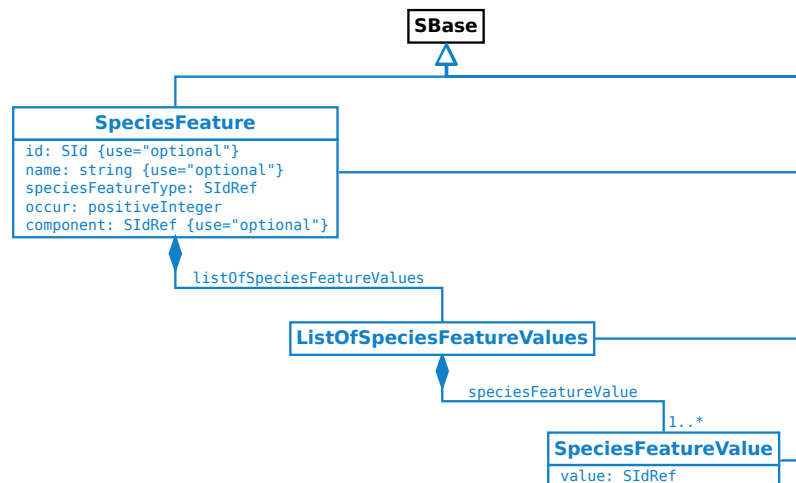

Figure 12: The definitions of the **SpeciesFeature** class and the **SpeciesFeatureValue** class

### 3.18.1 The id and name attributes

The optional **id** attribute, of type **SId**, can serve to provide a way to identify a **speciesFeature**. If present, the value must be unique within the **species**. **SpeciesFeature** also has an optional **name** attribute of type **string**.

### 3.18.2 The speciesFeatureType attribute

**SpeciesFeature** has a required attribute **speciesFeatureType**, of type **SIIdRef**, used to reference a **speciesFeatureType**.

### 3.18.3 The occur attribute

**SpeciesFeature** has a required attribute **occur**, of type of **positiveInteger**, used to define the number of instances of the referenced **speciesFeatureType**.

The value of the **occur** attribute cannot be larger than the **occur** of the referenced **speciesFeatureType**. When a **speciesFeatureType** has multiple instances (**speciesFeatureType**'s **occur** > "1"), the **speciesFeature**'s **occur** attribute provides a way for a **species** to define the instances of the **speciesFeatureType** differently.

For example, in a **speciesType**, **speciesFeatureType** "ftA" has **occur**="2" and two **possibleSpeciesFeatureValues** "fva1" and "fva2". A **species** referencing the **speciesType** can be defined to have two **speciesFeatures** "sfA1" and "sfA2" both referencing "ftA". The **speciesFeature** "sfA1" has **occur**="1" and its value is "fva1". The **speciesFeature** "sfA2" has **occur**="1" and its value is "fva2".

If the **occur** of a **speciesFeature** is less than the **occur** of the referenced **speciesFeatureType**, the rest of the unspecified instances of the **speciesFeatureType** are in *don't care* state which means that the value of an unspecified instance can be any from the **listOfPossibleSpeciesFeatureValues**.

For example, in a **speciesType**, a **speciesFeatureType** "phosphorylation" has two **possibleSpeciesFeatureValues** "phosphorylated" and "unphosphorylated" and the **occur** is "5". A **species** referencing the **speciesType** can be defined to have a **speciesFeature** of the "phosphorylation" with the value of "phosphorylated" and the **occur** of "1". Then, the **species** is a pattern **species** with at least one "phosphorylated" site (the other four "phosphorylation" sites are in *don't care* state). This pattern **species** can be mapped by anyone of the *fully defined species* (see [Section 3.19 on page 34](#)) of the same type and with any of "1" to "5" phosphorylated sites.

### 3.18.4 The component attribute

The optional **component** attribute, of type **SIIdRef**, can be used to indicate which **component** of a **species** the **speciesFeature** belongs to. It is required when the **component** cannot be identified only based on the **speciesFeatureType** attribute.

### 3.18.5 ListOfSpeciesFeatureValues

**ListOfSpeciesFeatureValues** is defined in [Figure 12 on the previous page](#), and is extended from the **ListOf** class. A **listOfSpeciesFeatureValues** must have one or more **SpeciesFeatureValue** children. If a **listOfSpeciesFeatureValues** has multiple **speciesFeatureValues**, the interpretation of the relationship between them is "or". Since **ListOfSpeciesFeatureValues** is derived from **SBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.18.6 SpeciesFeatureValue

**SpeciesFeatureValue** is defined in [Figure 12 on the preceding page](#). A **speciesFeatureValue** serves to specify a value for a **speciesFeature** to select from the **listOfPossibleSpeciesFeatureValues** defined in the referenced **speciesFeatureType**. The **SpeciesFeatureValue** class has only one attribute **value**, of type **SIIdRef**, used to reference a **PossibleSpeciesFeatureValue** object. Since **SpeciesFeatureValue** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

### 3.18.7 Example

[Figure 13 on the next page](#) is an example **speciesType** to illustrate the usage of the **ListOfSpeciesFeatures**, **SubListOfSpeciesFeatures** and **SpeciesFeature** classes. **SpeciesType** "st\_X" has **speciesTypeInstance** "sti\_A" with **speciesFeatureType** "fA", and **speciesTypeInstance** "sti\_B" with **speciesFeatureTypes** "fB1" and "fB2". The

speciesFeatureType “fA” has two possibleSpeciesFeatureValues “v1” and “v2”. The speciesFeatureType “fB1” has “v3” and “v4”, and “fB2” has “v5” and “v6”. Here are several ways to construct the listOfSpeciesFeatures of a species referencing the speciesType “st\_X”:

- Species “sp\_X1”: listOfSpeciesFeatures(“fA”=“v1”, “fB1”=“v3”, “fB2”=“v5”) represents a state:  
“[fA=v1] AND [fB1=v3] AND [fB2=v5]”
- Species “sp\_X2”: listOfSpeciesFeatures(“fA”=“v1”, “fB1”=“v3”) represents a state:  
“[fA=v1] AND [fB1=v3] AND ([fB2=v5] OR fB2=v6)”  
“fB2” has a value of *don't care*
- Species “sp\_X3”: listOfSpeciesFeatures(  
“fA=v1”,  
subListOfSpeciesFeatures (“fB1=v3”, “fB2=v5”, relation=“not”)  
) represents states:  
“[fA=v1] and [fB1=v4] and [fB2=v5]” or  
“[fA=v1] and [fB1=v4] and [fB2=v6]” or  
“[fA=v1] and [fB1=v3] and [fB2=v6]”

Figure 13: An example speciesFeatureType to illustrate the usage of [ListOfSpeciesFeatures](#), [SubListOfSpeciesFeatures](#) and the [SpeciesFeature](#)

The SBML code for the speciesTypes “st\_A”, “st\_B”, and “st\_X”, and the species “sp\_X3” can be as follows:

```
<multi:listOfSpeciesTypes>
  <multi:speciesType multi:id="st_A" ... >
    <multi:listOfSpeciesFeatureTypes>
      <multi:speciesFeatureType multi:id="fA" multi:occur="1">
        <multi:listOfPossibleSpeciesFeatureValues>
          <multi:possibleSpeciesFeatureValue multi:id="v1" />
          <multi:possibleSpeciesFeatureValue multi:id="v2" />
        </multi:listOfPossibleSpeciesFeatureValues>
      </multi:speciesFeatureType>
    </multi:listOfSpeciesFeatureTypes>
    ...
  </multi:speciesType>
  <multi:speciesType multi:id="st_B" ... >
    <multi:listOfSpeciesFeatureTypes>
      <multi:speciesFeatureType multi:id="fB1" multi:occur="1">
        <multi:listOfPossibleSpeciesFeatureValues>
          <multi:possibleSpeciesFeatureValue multi:id="v3" />
          <multi:possibleSpeciesFeatureValue multi:id="v4" />
        </multi:listOfPossibleSpeciesFeatureValues>
      </multi:speciesFeatureType>
      <multi:speciesFeatureType multi:id="fB2" multi:occur="1">
        <multi:listOfPossibleSpeciesFeatureValues>
```

```

    <multi:possibleSpeciesFeatureValue multi:id="v5" />
    <multi:possibleSpeciesFeatureValue multi:id="v6" />
  </multi:listOfPossibleSpeciesFeatureValues>
</multi:speciesFeatureType>
</multi:listOfSpeciesFeatureTypes>
...
</multi:speciesType>
<multi:speciesType multi:id="st_X" ... >
  <multi:listOfSpeciesTypeInstances>
    <multi:speciesTypeInstance multi:id="sti_A" multi:speciesType="st_A" />
    <multi:speciesTypeInstance multi:id="sti_B" multi:speciesType="st_B" />
  </multi:listOfSpeciesTypeInstances>
  ...
</multi:speciesType>
...
</multi:listOfSpeciesTypes>
<listOfSpecies>
  <species id="sp_X3" name="X3" multi:speciesType="st_X" ... >
    <multi:listOfSpeciesFeatures>
      <multi:speciesFeature multi:speciesFeatureType="fA" multi:occur="1">
        <multi:listOfSpeciesFeatureValues>
          <multi:speciesFeatureValue multi:value="v1" />
        </multi:listOfSpeciesFeatureValues>
      </multi:speciesFeature>
      <multi:subListofSpeciesFeatures multi:relation="not">
        <multi:speciesFeature multi:speciesFeatureType="fB1" multi:occur="1">
          <multi:listOfSpeciesFeatureValues>
            <multi:speciesFeatureValue multi:value="v3" />
          </multi:listOfSpeciesFeatureValues>
        </multi:speciesFeature>
        <multi:speciesFeature multi:speciesFeatureType="fB2" multi:occur="1">
          <multi:listOfSpeciesFeatureValues>
            <multi:speciesFeatureValue multi:value="v5" />
          </multi:listOfSpeciesFeatureValues>
        </multi:speciesFeature>
      </multi:subListofSpeciesFeatures>
    </multi:listOfSpeciesFeatures>
  </species>
  ...

### 3.19 Fully defined species and mapping to pattern species

An extended **Species** object functions as a template or a pattern which allows multiple pools of entities to map to it. A **species** is *fully defined* if there is only one pool mapping to it. A *fully defined species* can be considered the same as an SBML core **species**, and can be initialized with the **initialAmount** attribute, or the **initialConcentration** attribute, or via an **InitialAssignment** object. In the Multi package, a **species** is *fully defined* if the following conditions are fulfilled:

- All **outwardBindingSites** must be free (**bindingStatus**=“unbound”), since “bound” sites imply that there is a non-specified binding partner.
- Each **speciesFeature** occurrence can only have one **speciesFeatureValue**, and every occurrence of every **speciesFeatureType** of every **component** of the referenced **speciesType** must be referenced by exactly one **speciesFeature** occurrence.
- If applicable, only “and” values are allowed for the **relation** attributes of the **SubListOfSpeciesFeatures** objects.
- Only one single **SpeciesFeatureValue** object is allowed for any **speciesFeature**.
- The referenced **compartment** cannot be a **compartment type**, which means the value of the **isType** attribute of the referenced **compartment** can only be “false”.

The mapping from a *fully defined species* to a *pattern species* is implicit and can be inferred from the structure of the **species**. For example, a **speciesType** “stA” has one **speciesFeatureType** with two **possibleSpeciesFeatureValues** “v1” and “v2”. The **species** “spA1” references “stA” and has the **speciesFeature** with the value of “v1”. Another **species** “spA” also references “stA” and has no **speciesFeature** explicitly defined. Thus, the **species** “spA1” is a *fully defined species* and can map to the *pattern species* “spA” because **species** “spA” has an implicit **speciesFeature** which can take either value “v1” or value “v2” (see the note in [Section 3.15.3 on page 27](#)).

## 3.20 Reaction

**Reaction** itself in the Multi package is not extended, but it may use the Multi **Species** objects to construct reactions. The **Reaction** class in the Multi package cannot only define the relations among pools (SBML core **species**), but also the relations among patterns (Multi extended **species**). Several related classes including **SimpleSpeciesReference** and **SpeciesReference** are extended to handle some issues specific to the Multi package. A new class, **IntraSpeciesReaction**, is derived from **Reaction** to explicitly define those reactions within the same **Species** object.

The changes under the **Reaction** class in the Multi package are illustrated in Figure 14.

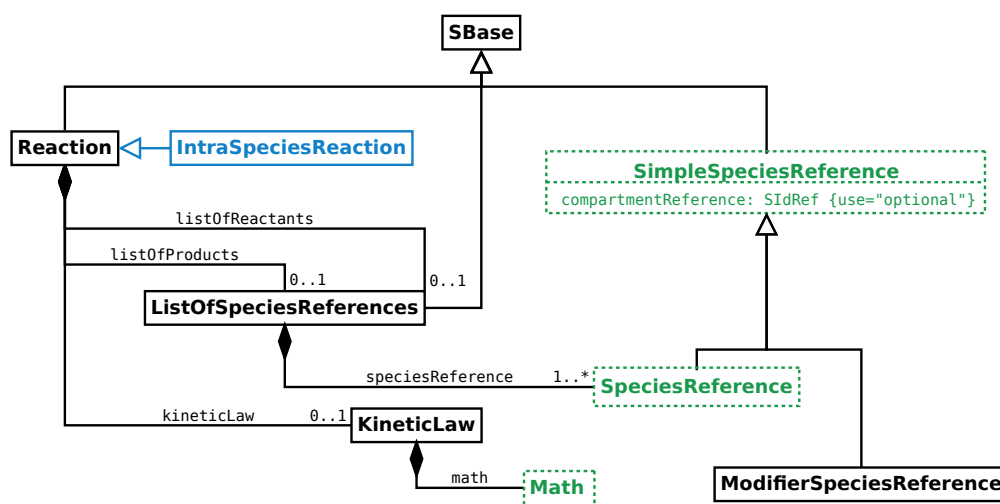

Figure 14: The changes under the **Reaction** class including **IntraSpeciesReaction**, **SimpleSpeciesReference**, **SpeciesReference** and **Math**

## 3.21 IntraSpeciesReaction

**IntraSpeciesReaction** is derived from **Reaction** for the reactions happening within a **species** (see the example “Extended Reaction class” at page 23 of the slides at HARMONY 2013 [Zhang and Meier-Schellersheim (2013b)]).

A particular **reaction** may happen within a **species** as an **intraSpeciesReaction** if the following conditions are fulfilled:

- The **reaction** is either an association **reaction** or a dissociation **reaction**.
- If it is an association **reaction**, each of the two reactant **species** has at least one **outwardBindingSite** free (“unbound”).
- If it is a dissociation **reaction**, each of the two product **species** has at least one **outwardBindingSite** free (“unbound”).

### Note:

Technically, transformations are also reactions happening with one **species**, but they do not have the ambiguity of association and dissociation reactions. Therefore, transformation reactions do not have to be defined as **intraSpeciesReactions**.

## 3.22 Extended SimpleSpeciesReference

The `SimpleSpeciesReference` class is extended with a new optional attribute `compartmentReference`, of type `SIdRef`, to reference a `compartmentReference`. The `compartmentReference` attribute can serve to indicate in which sub-compartment an object of a class (`SpeciesReference` or `ModifierSpeciesReference`) inheriting `SimpleSpeciesReference` is located.

Figure 15: Reaction:  $spA(cr1) + spA(cr2) \rightarrow spAA$

This example illustrates the use of the `compartmentReference` attribute in `simpleSpeciesReferences`. The situation described here could correspond to interactions among species located on two adjacent membranes. A model has a composite compartment “cc” with two compartmentReferences “cr1” and “cr2”, and both reference “c” subcomponents. Species “spA” references compartment “c”, and species “spAA” references the composite compartment “cc”. A reaction happens between two “spA” species from the two “c” compartments and results in a cross-compartment product. The SBML code can be as follows:

```
<listOfCompartments>
  <compartment id="c" constant="true" multi:isType="true" />
  <compartment id="cc" constant="true" multi:isType="true">
    <multi:listOfCompartmentReferences>
      <multi:compartmentReference multi:id="cr1" multi:compartment="c" />
      <multi:compartmentReference multi:id="cr2" multi:compartment="c" />
    </multi:listOfCompartmentReferences>
  </compartment>
</listOfCompartments>
<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="stA" multi:compartment="c" />

### 3.23 Extended SpeciesReference

The **SpeciesReference** class is extended from SBML Level 3 Core and can establish **component** mappings between the reactant **species** and the product **species** when the mappings cannot be inferred from the **ids** of the **SpeciesTypeInstance** objects. The **SpeciesReference** class has an optional **ListOfSpeciesTypeComponentMapsInProduct** child, as defined in Figure 16. Only a reaction product can contain the **ListOfSpeciesTypeComponentMapsInProduct** child and it is not necessary to store the mappings again in the reactants.

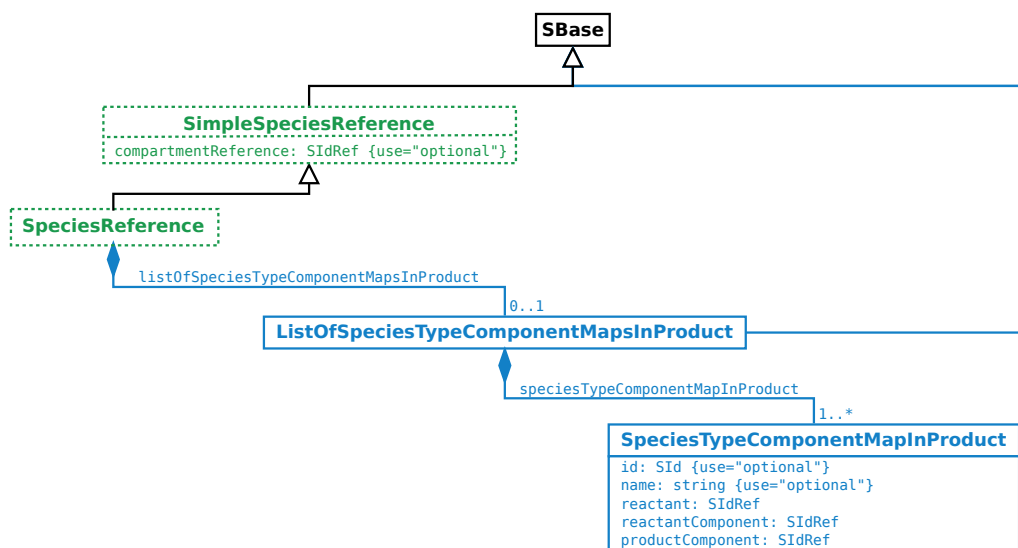

Figure 16: The extension of the **SpeciesReference** class

#### 3.23.1 ListOfSpeciesTypeComponentMapsInProduct

**ListOfSpeciesTypeComponentMapsInProduct** is defined in Figure 16, and is extended from the **ListOf** class. If present, a **listOfSpeciesTypeComponentMapsInProduct** must have one or more **SpeciesTypeComponentMapInProduct** children. Since **ListOfSpeciesTypeComponentMapsInProduct** is derived from **SBBase** through **ListOf**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

## 3.24 SpeciesTypeComponentMapInProduct

**SpeciesTypeComponentMapInProduct** is defined in [Figure 16 on the preceding page](#). It has two optional attributes, **id** and **name**, and three required attributes, **reactant**, **reactantComponent** and **productComponent**. Since **SpeciesTypeComponentMapInProduct** is derived from **SBase**, it inherits the **sboTerm** and **metaid** attributes, as well as the optional children **Notes** and **Annotation** objects.

A **speciesTypeComponentMapInProduct** defines the mapping between a **component** in a reactant and a **component** in a product. The identifications of a **component** and the **speciesReference** should be sufficient to identify the **component** in the context of a reaction. The attributes **reactant** and **reactantComponent** can identify the **component** in a reactant, and the **productComponent** attribute and the product storing the mapping information can identify the **component** in a product.

### 3.24.1 The id and name attributes

The optional **id** attribute, of type **SId**, can serve to provide a way to identify an **speciesTypeComponentMapInProduct**. If present, the value must be unique within the **reaction**. **SpeciesTypeComponentMapInProduct** also has an optional **name** attribute of type **string**.

### 3.24.2 The reactant attribute

**SpeciesTypeComponentMapInProduct** has a required **reactant** attribute, of type **SIdRef**, to reference the **id** of a reactant **speciesReference** in a reaction.

### 3.24.3 The reactantComponent attribute

**SpeciesTypeComponentMapInProduct** has a required **reactantComponent** attribute, of type **SIdRef**, to reference a **component** in a reactant species.

### 3.24.4 The productComponent attribute

**SpeciesTypeComponentMapInProduct** has a required **productComponent** attribute, of type **SIdRef**, to reference a **component** in a product species.

### 3.25 OutwardBindingSites and speciesFeatures in *don't care* state in reaction products

An outwardBindingSite is in *don't care* state if its bindingStatus is “either” or is not specified (also see [Section 3.15.2 on page 26](#)). A speciesFeature is in *don't care* state if it is not specified in the referencing species (also see [Section 3.18 on page 30](#)).

For a species as a product in a reaction, if it has *don't care* outwardBindingSites or *don't care* speciesFeatures, the interpretation of the *don't care* is *don't change*. In a product, a *don't care* outwardBindingSite has the same bindingStatus as the mapped outwardBindingSite in the reactant, and a *don't care* speciesFeature has the same value as the mapped speciesFeature in the reactant.

## 3.26 Extended ci elements in Math objects

The Multi package extends the ci element in **Math** in **Reaction** with optional attributes **speciesReference** and **representationType**.

### 3.26.1 The speciesReference attribute

The optional **speciesReference** attribute, of type **SIIDRef**, can only be used when the content of the **ci** element is a **species id**, or when the content of the **ci** element is a **speciesFeature id**. The **speciesReference** attribute can identify which **species** is referenced in a **reaction**, and the **speciesReference** attribute must have a value of a **speciesReference id** within the same **reaction**.

If the **ci** content references a **species' id**, the **id** represents the concentration or amount of the **species**.

If the **ci** content references a **speciesFeature's id**, the **id** represents the count of the **speciesFeature** instances with the **speciesFeatureValue** (also see [Section 3.18.1 on page 30](#)).

The example in [Section 3.22 on page 36](#) can be further extended with a block of **kineticLaw** in the **reaction** to illustrate the use of the **speciesReference** attribute with a **species' id**.

```
<reaction id="reaction" ... >
  ...
  <kineticLaw>
    <math xmlns="http://www.w3.org/1998/Math/MathML">
      <apply>
        <times />
        <ci> k </ci>
        <ci multi:speciesReference="r1"> spA </ci>
        <ci multi:speciesReference="r2"> spA </ci>
      </apply>
    </math>
    <listOfLocalParameters>
      <localParameter id="k" value="0.1" ... />
    </listOfLocalParameters>
  </kineticLaw>
</reaction>
```

Two “spA” species are distinguished by the “r1” and “r2” **speciesReferences** respectively.

### 3.26.2 The representationType attribute

The optional **representationType** attribute, of type **RepresentationType**, can only be used when the content of the **ci** element is a **species' id** or a **possibleSpeciesFeatureValue's id**. The **representationType** and **speciesReference** attributes can both be used for the same **ci** element at the same time.

The **representationType** attribute can only have the value of “sum” when the content of the **ci** is the id of a **species**. The interpretation of such a **ci** element is the total concentration or amount of all *fully defined species* (see [Section 3.19 on page 34](#)) mapping to the referenced pattern **species**.

The **representationType** attribute can have the value of **numericValue** when the content of the **ci** is the id of a **possibleSpeciesFeatureValue** and the **speciesReference** attribute must be defined. The interpretation of such a **ci** is the same as a **ci** element having a **parameter** which the **possibleSpeciesFeatureValue** links via its **numericValue** attribute.

The following example demonstrates the use of this attribute for “sum” of **species** concentrations.

$$k_1 \cdot Si / (k_2 + \text{SUM}(Si))$$

In this example, the reactant “Si” is a pattern **species** which may have multiple *fully defined species* mapping to it, for example **species** “S1”, “S2”, ..., “Sn”. “SUM(Si)” is a function to calculate the total concentration of all *fully*

*defined* species mapping to “Si”. The **product** can be another pattern species “Pi”. The SBML code for the math expression can be as follows:

```

<reaction id="r">
  <listOfReactants>
    <speciesReference species="Si" />
  </listOfReactants>
  <listOfProducts>
    <speciesReference species="Pi" />
  </listOfProducts>
  <kineticLaw>
    <math xmlns="http://www.w3.org/1998/Math/MathML">
      <apply>
        <divide>
          <apply>
            <times />
            <ci>Si</ci>
            <ci>k1</ci>
          </apply>
          <apply>
            <plus />
            <ci>k2</ci>
            <ci multi:representationType="sum">Si</ci>
          </apply>
        </divide>
      </apply>
    </math>
    <listOfLocalParameters>
      <localParameter id="k1" ... />
      <localParameter id="k2" ... />
    </listOfLocalParameters>
  </kineticLaw>
</reaction>

```

The math expressions for the individual species in the example can be:

```

For species S1:   k1*S1/(k2 + (S1 + S2 + ... + Sn))
For species S2:   k1*S2/(k2 + (S1 + S2 + ... + Sn))
...
For species Sn:   k1*Sn/(k2 + (S1 + S2 + ... + Sn))

```

## 3.27 Namespace scoping rules for identifiers

In the Multi package, as in SBML Level 3 Version 1 Core, the **Model** object contains the main components of an SBML model, such as **species**, **compartments** and **reactions**. The package defines new classes within a model and the scope of the identifiers of those new classes should be defined to prevent identifier collisions. In this section, we describe the scoping rules for all of the types and classes defined in [Section 3.4](#) to [Section 3.26](#) on pages 11–41.

1. The namespace for **SIId** identifiers defined within a **Model** object used in the Multi package follows the same rules as those defined in SBML Level 3 Version 1 Core for plain **Model** objects. The scope of the identifiers is limited to the enclosing **Model** object.
2. The identifier of every **SpeciesType** and **PossibleSpeciesFeatureValue** object defined in the Multi package must be unique across the set of all identifiers in the **Model** object in which it is located.
3. The identifier of every **SpeciesTypeInstance**, **SpeciesTypeComponentIndex**, **InSpeciesTypeBond** and **Species-FeatureType** object defined in the Multi package must be unique across the set of all identifiers of the same class under the direct parent **SpeciesType** object in which it is located.
4. The identifier of every **SpeciesFeature** and **SubListOfSpeciesFeatures** object defined in the Multi package must be unique across the set of all identifiers in the **Species** object in which it is located.
5. The identifier, if defined, of every **CompartmentReference** object defined in the Multi package must be unique across the set of all identifiers in the **Compartment** object in which it is located.

## 4 Examples

This section contains examples employing the Multi package for SBML Level 3.

### 4.1 Example: **Compartment**, **SpeciesType**, and **Species**

Figure 17: Diagram for an example of **Compartment**, **SpeciesType** and **Species**

Figure 17 shows an example illustrating the usages of and relations among the **Compartment**, **SpeciesType** and **Species** classes.

“ct” is a compartment type. “cct” is a composite compartment type with two compartmentReferences “cr1” and “cr2” both referencing “ct”. “c1” is a “not-a-type” compartment and references “ct”. Similarly, “c2” is also a “not-a-type” compartment and references “ct”. “cc” is a composite “not-a-type” compartment composed of “c1” and “c2”.

“stX” is a speciesType on the “ct” compartment. “stXXcis” is a speciesType on the “ct” compartment, and has two speciesTypeInstances “stiX1” and “stiX2” both of that reference the “stX” speciesType. “stXXtrans” is a speciesType on the “cct” compartment with two speciesTypeInstances “stiX1” and “stiX2” sitting in different sub-compartments.

“spX” is a species referencing speciesType “stX”. “spXXcis” is a species referencing “stXXcis”. “spX1” is a species referencing “stX” and sitting in the “c1” compartment. “spX2” is a species also referencing “stX”, but sitting in “c2”. “spXXtrans” is a species referencing “stXXtrans”. “spXXcis1” is a species referencing “stXXtrans” and sitting in “c1”. “spXXcis2” is a species referencing “stXXtrans” and sitting in “c2”.

“spX1”, “spX2”, “spXXtrans”, “spXXcis1” and “spXXcis2” are *fully defined* species (see Section 3.19 on page 34).

The SBML code can be as follows:

```

<listOfCompartments>
  <compartment id="ct" multi:isType="true" />
  <compartment id="cct" multi:isType="true">
    <multi:listOfCompartmentReferences>
      <multi:compartmentReference multi:id="cr1" multi:compartment="ct" />
      <multi:compartmentReference multi:id="cr2" multi:compartment="ct" />
    </multi:listOfCompartmentReferences>
  </compartment>
  <compartment id="c1" multi:isType="false" multi:compartmentType="ct" />
  <compartment id="c2" multi:isType="false" multi:compartmentType="ct" />
  <compartment id="cc" multi:isType="false" multi:compartmentType="cct">
    <multi:listOfCompartmentReferences>
      <multi:compartmentReference multi:compartment="c1" />
      <multi:compartmentReference multi:compartment="c2" />
    </multi:listOfCompartmentReferences>
  </compartment>
</listOfCompartments>
<multi:listOfSpeciesTypes>
  <multi:bindingSiteSpeciesType multi:id="stX" multi:compartment="ct" />
  <multi:speciesType multi:id="stXXcis" multi:compartment="ct">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="stiX1" multi:speciesType="stX" />
      <multi:speciesTypeInstance multi:id="stiX2" multi:speciesType="stX" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="stiX1" multi:bindingSite2="stiX2" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
  <multi:speciesType multi:id="stXXtrans" multi:compartment="cct">
    <multi:listOfSpeciesTypeInstances>
      <multi:speciesTypeInstance multi:id="stiX1" multi:speciesType="stX"
        multi:compartmentReference="cr1" />
      <multi:speciesTypeInstance multi:id="stiX2" multi:speciesType="stX"
        multi:compartmentReference="cr2" />
    </multi:listOfSpeciesTypeInstances>
    <multi:listOfInSpeciesTypeBonds>
      <multi:inSpeciesTypeBond multi:bindingSite1="stiX1" multi:bindingSite2="stiX2" />
    </multi:listOfInSpeciesTypeBonds>
  </multi:speciesType>
</multi:listOfSpeciesTypes>
<listOfSpecies>
  <species id="spX" multi:speciesType="stX" compartment="ct" />
  <species id="spXXcis" multi:speciesType="stXXcis" compartment="ct" />
  <species id="spX1" multi:speciesType="stX" compartment="c1" /> <!-- Fully defined -->
  <species id="spX2" multi:speciesType="stX" compartment="c2" /> <!-- Fully defined -->
  <species id="spXXtrans" multi:speciesType="stXXtrans" compartment="cc" /> <!-- Fully defined -->
  <species id="spXXcis1" multi:speciesType="stXXcis" compartment="c1" /> <!-- Fully defined -->
  <species id="spXXcis2" multi:speciesType="stXXcis" compartment="c2" /> <!-- Fully defined -->
</listOfSpecies>

```

## 4.2 *Simmune* example: the Ecad model

The *Simmune* toolset (<http://go.usa.gov/QeH>) has some example models including the published Ecad model [Angermann et al. (2012)]. The Ecad model describes the interactions between E-cadherin receptors that can associate either with other E-cadherin receptors within the same membrane (in “cis”) or with E-cadherin receptors on adjacent membranes (in “trans”). This model is transformed into the SBML Level 3 format with use of the Multi package.

```

<!-- In-species cis dissociation: By specifying that this reaction breaks only an inner bond,
the model limits the application of this reaction to dissociations that result in only one
reaction product. The complex is still connected through a subcomplex that is not shown
here but that links the two molecules involved in the reaction at their trans binding
sites. Note that the modeler application has to ensure the correct application of this
rule and its consistent definition. For instance, specifying the one or both of the trans
binding sites to be unbound would lead to a rule that could never be applied because the
trans bindings are required for the connectivity of the result complex.

## A Validation of SBML documents using Multi constructs

This section summarizes all the conditions that should be true of an SBML Level 3 Version 1 model that uses the Multi package. We use the same conventions that are used in the SBML Level 3 Version 1 Core specification document. In particular, there are different degrees of rule strictness. Formally, the differences are expressed in the statement of a rule: either a rule states that a condition *must* be true, or a rule states that it *should* be true. Rules of the former kind are strict SBML validation rules—a model encoded in SBML must conform to all of them in order to be considered valid. Rules of the latter kind are consistency rules. To help highlight these differences, we use the three symbols next to the rule numbers as described in section A of the SBML Level 3 Version 1 Core specification document:

- ☑ A checked box indicates a *requirement* for SBML conformance. If a model does not follow this rule, it does not conform to the Multi package specification. (Mnemonic intention behind the choice of symbol: “This must be checked.”)
- ▲ A triangle indicates a *recommendation* for model consistency. If a model does not follow this rule, it is not considered strictly invalid as far as the Multi package specification is concerned; however, it indicates that the model contains a physical or conceptual inconsistency. (Mnemonic intention behind the choice of symbol: “This is a cause for warning.”)
- ★ A star indicates a strong recommendation for good modeling practice. This rule is not strictly a matter of SBML encoding, but the recommendation comes from logical reasoning. As in the previous case, if a model does not follow this rule, it is not considered an invalid SBML encoding. (Mnemonic intention behind the choice of symbol: “You’re a star if you heed this.”)

The validation rules listed in the following subsections are all stated or implied in the rest of this specification document. They are enumerated here for convenience. Unless explicitly stated, all validation rules concern objects and attributes specifically defined in the Multi package.

For convenience and brevity, we use the shorthand “`multi:x`” to stand for an attribute or element name `x` in the namespace for the Multi package, using the namespace prefix `multi`. We use “`multi:x`” because it is shorter than to write a full explanation everywhere we refer to an attribute or element in the Multi package namespace.

### General rules about the Multi package

- multi-10101** ☑ To conform to Version 1 of the Multi package specification for SBML Level 3, an SBML document must declare the use of the following XML Namespace:  
“`http://www.sbml.org/sbml/level3/version1/multi/version1`”. (References: SBML Level 3 Package Specification for Multi Version 1, [Section 3.1 on page 9](#).)
- multi-10102** ☑ Wherever they appear in an SBML document, elements and attributes from the Multi package must be declared either implicitly or explicitly to be in the XML namespace  
“`http://www.sbml.org/sbml/level3/version1/multi/version1`”. (References: SBML Level 3 Package Specification for Multi Version 1, [Section 3.1 on page 9](#).)

### General rules about MathML content in the Multi package

- multi-10201** ☑ A `ci` element in a **Math** object may have the optional attributes `multi:speciesReference` and `multi:representationType`. No other attributes from the Multi namespace are permitted on a `ci` element. (References: [Section 3.26 on page 41](#).)
- multi-10202** ☑ The value of the `multi:speciesReference` attribute on a given `ci` element must be the identifier of a **SpeciesReference** object within the same reaction. (References: [Section 3.26.1 on page 41](#).)

- multi-10203** ✓ The value of the `multi:representationType` attribute on a given `ci` element must conform to the syntax of the Multi data type `RepresentationType`. (References: [Section 3.26.2 on page 41.](#))

## General rules about identifiers

- multi-10301** ✓ (Extends validation rule #10301 in the SBML Level 3 Version 1 Core specification.) Within a **Model** object, the values of the attributes `id` and `multi:id` on every instance of the following classes of objects must be unique across the set of all `id` and `multi:id` attribute values of all such objects in a model: the **Model** itself, plus all contained **FunctionDefinition**, **Compartment**, **Species**, **Reaction**, **SpeciesReference**, **ModifierSpeciesReference**, **Event**, and **Parameter** objects, plus the `SpeciesType` and `PossibleSpeciesFeatureValue` objects defined by the Multi package, and any objects defined by any other package with `package:id` attributes defined as falling in the 'Sid' namespace. (References: [Section 3.27 on page 43.](#))
- multi-10302** ✓ The value of a `multi:id` attribute must always conform to the syntax of the SBML data type `SIId`. (References: SBML Level 3 Version 1 Core, Section 3.1.7.)
- multi-10303** ✓ The value of a `multi:name` attribute must always conform to the syntax of type `string`. (References: SBML Level 3 Version 1 Core, Section 3.1.1.)
- multi-10304** ✓ The value of a `multi:id` attribute on `SpeciesTypeInstance` objects must be unique across the set of all `multi:id` attribute values of all the `SpeciesTypeInstance` objects under the direct parent `SpeciesType` object in which it is located. (References: [Section 3.11.1 on page 18](#) and [Section 3.27 on page 43.](#))
- multi-10305** ✓ The value of a `multi:id` attribute on `SpeciesTypeComponentIndex` objects must be unique across the set of all `multi:id` attribute values of all the `SpeciesTypeComponentIndex` objects under the direct parent `SpeciesType` object in which it is located. (References: [Section 3.12.1 on page 20](#) and [Section 3.27 on page 43.](#))
- multi-10306** ✓ The value of a `multi:id` attribute on `InSpeciesTypeBond` objects must be unique across the set of all `multi:id` attribute values of all the `InSpeciesTypeBond` objects under the direct parent `SpeciesType` object in which it is located. (References: [Section 3.13.1 on page 23](#) and [Section 3.27 on page 43.](#))
- multi-10307** ✓ The value of a `multi:id` attribute on `SpeciesFeatureType` objects must be unique across the set of all `multi:id` attribute values of all the `SpeciesFeatureType` objects under the direct parent `SpeciesType` object in which it is located. (References: [Section 3.9.1 on page 16](#) and [Section 3.27 on page 43.](#))
- multi-10308** ✓ The value of a `multi:id` attribute on `SubListOfSpeciesFeatures` objects must be unique across the set of all `id` and `multi:id` attribute values of all objects in the `Species` object in which it is located. (References: [Section 3.17.1 on page 30](#) and [Section 3.27 on page 43.](#))
- multi-10309** ✓ The value of a `multi:id` attribute on `SpeciesFeature` objects must be unique across the set of all `id` and `multi:id` attribute values of all objects in the `Species` object in which it is located. (References: [Section 3.18.1 on page 30](#) and [Section 3.27 on page 43.](#))
- multi-10310** ✓ The value of a `multi:id` attribute on `CompartmentReference` objects must be unique across the set of all `id` and `multi:id` attribute values of all objects in the `Compartment` object in which it is located. (References: [Section 3.6.1 on page 13](#) and [Section 3.27 on page 43.](#))
- multi-10311** ✓ The value of a `multi:compartment` attribute on `SpeciesType` objects must conform to the syntax of the SBML data type `SIIdRef`. (References: [Section 3.8.2 on page 14.](#))

<b>multi-10312</b> ✓	The value of a <code>multi:numericValue</code> attribute on <b>PossibleSpeciesFeatureValue</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.10.2 on page 17.</a> )	1 2
<b>multi-10313</b> ✓	The value of a <code>multi:speciesType</code> attribute on <b>SpeciesTypeInstance</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.11.2 on page 18.</a> )	3 4
<b>multi-10314</b> ✓	The value of a <code>multi:compartmentReference</code> attribute on <b>SpeciesTypeInstance</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.11.3 on page 18.</a> )	5 6
<b>multi-10315</b> ✓	The value of a <code>multi:component</code> attribute on <b>SpeciesTypeComponentIndex</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.12.2 on page 20.</a> )	7 8
<b>multi-10316</b> ✓	The value of a <code>multi:identifyingParent</code> attribute on <b>SpeciesTypeComponentIndex</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.12.3 on page 20.</a> )	9 10 11
<b>multi-10317</b> ✓	The value of a <code>multi:bindingSite1</code> attribute on <b>InSpeciesTypeBond</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.13.2 on page 23.</a> )	12 13

<b>multi-10328</b> ✓	The value of a <code>multi:compartmentType</code> attribute on <b>Compartment</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.5.2 on page 12.</a> )	38 39
<b>multi-10329</b> ✓	The value of a <code>multi:compartment</code> attribute on <b>CompartmentReference</b> objects must conform to the syntax of the SBML data type <code>SIIdRef</code> . (References: <a href="#">Section 3.6.2 on page 13.</a> )	40 41

## Rules for extended SBML object

- multi-20101 ✓ The `multi:required` attribute is required on the `<sbml>` element in the Multi package. (References: SBML Level 3 Package Specification for Multi Version 1, [Section 3.1 on page 9.](#))
- multi-20102 ✓ The `multi:required` attribute on the `<sbml>` element must be `Boolean`. (References: SBML Level 3 Package Specification for Multi Version 1, [Section 3.1 on page 9.](#))
- multi-20103 ✓ The value of the `multi:required` attribute on the `<sbml>` element must be `"true"`. (References: SBML Level 3 Package Specification for Multi Version 1, [Section 3.1 on page 9.](#))

## Rules for extended Model objects

- multi-20201 ✓ There may be at most one `ListOfSpeciesTypes` container object within a `Model` object. (References: [Section 3.4 on page 11.](#))
- multi-20202 ✓ A `ListOfSpeciesTypes` object within an extended `Model` object is optional, but if present, must not be empty. (References: [Section 3.4 on page 11.](#))
- multi-20203 ✓ A `ListOfSpeciesTypes` object may have the optional SBML core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a `ListOfSpeciesTypes` object. (References: [Section 3.4.1 on page 11.](#))
- multi-20204 ✓ Apart from the general `notes` and `annotation` subobjects permitted on all SBML objects, a `ListOfSpeciesTypes` container object may only contain `SpeciesType` objects. (References: [Section 3.4.1 on page 11.](#))

## Rules for extended Compartment objects

- multi-20301 ✓ An extended `Compartment` object must have the required attribute `multi:isType`, and may also have the optional attribute `multi:compartmentType`. No other attributes from the Multi namespace are permitted on an extended `Compartment` object. (References: [Section 3.5 on page 12.](#))
- multi-20302 ✓ The value of a `multi:isType` attribute on an extended `Compartment` object must always confirm to the syntax of the SBML data type `boolean`. (References: [Section 3.5.1 on page 12.](#))
- multi-20303 ✓ The `multi:isType` attribute on an extended `Compartment` object is required. (References: [Section 3.5.1 on page 12.](#))
- multi-20304 ✓ The value of the `multi:isType` attribute of the `Compartment` object referenced by a `CompartmentReference` object must be the same as that of the `multi:isType` attribute of the parent `Compartment` object of the `ListOfCompartmentReferences` object which contains the `CompartmentReference` object. (References: [Section 3.7 on page 13.](#))
- multi-20305 ✓ The `multi:compartmentType` attribute on a `Compartment` object must not be defined if the value of the `multi:isType` is `"true"`. (References: [Section 3.5.2 on page 12.](#))
- multi-20306 ✓ There may be at most one `ListOfCompartmentReferences` container object within a `Compartment` object. (References: [Section 3.5.3 on page 12.](#))
- multi-20307 ✓ A `ListOfCompartmentReferences` object within a `Compartment` object is optional, but if present, must not be empty. (References: [Section 3.5.3 on page 12.](#))
- multi-20308 ✓ A `ListOfCompartmentReferences` object may have the optional SBML core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a `ListOfCompartmentReferences` object. (References: [Section 3.5.3 on page 12.](#))

- multi-20309** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfCompartmentReferences** container object may only contain **CompartmentReference** objects. (References: [Section 3.5.3 on page 12.](#))

## Rules for SpeciesType objects

- multi-20401** ✓ A **SpeciesType** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20402** ✓ A **SpeciesType** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20403** ✓ A **SpeciesType** object must have the required attribute **multi:id**, and may have the optional attributes **multi:name** and **multi:compartment**. No other attributes from the Multi namespace are permitted on a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20404** ✓ The value of the **multi:compartment** attribute, if set on a given **SpeciesType** object, must be the value of an **id** attribute on an existing **Compartment** object in the **SId** namespace of the parent **Model** object. (References: [Section 3.8.2 on page 14.](#))
- multi-20405** ✓ The various **ListOf\_\_** subobjects within a **SpeciesType** object are optional, but if present, these container objects must not be empty. Specifically, if any of the following classes of objects are present with a **SpeciesType** object, it must not be empty: **ListOfSpeciesFeatureTypes**, **ListOfSpeciesTypeInstances**, **ListOfSpeciesTypeComponentIndexes** and **ListOfInSpeciesTypeBonds**. (References: [Section 3.8 on page 14.](#))
- multi-20406** ✓ There may be at most one **ListOfSpeciesFeatureTypes** container object within a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20407** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfSpeciesFeatureTypes** container object may only contain **SpeciesFeatureType** objects. (References: [Section 3.8.3 on page 15.](#))
- multi-20408** ✓ A **ListOfSpeciesFeatureTypes** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesFeatureTypes** object. (References: [Section 3.8.3 on page 15.](#))
- multi-20409** ✓ There may be at most one **ListOfSpeciesTypeInstances** container object within a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20410** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfSpeciesTypeInstances** container object may only contain **SpeciesTypeInstance** objects. (References: [Section 3.8.4 on page 15.](#))
- multi-20411** ✓ A **ListOfSpeciesTypeInstances** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesTypeInstances**. (References: [Section 3.8.4 on page 15.](#))
- multi-20412** ✓ There may be at most one **ListOfSpeciesTypeComponentIndexes** container object within a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20413** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfSpeciesTypeComponentIndexes** container object may only contain **SpeciesTypeComponentIndex** objects. (References: [Section 3.8.6 on page 15.](#))

- multi-20414** ✓ A **ListOfSpeciesTypeComponentIndexes** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesTypeComponentIndexes** object. (References: [Section 3.8.6 on page 15.](#))
- multi-20415** ✓ There may be at most one **ListOfInSpeciesTypeBonds** container object within a **SpeciesType** object. (References: [Section 3.8 on page 14.](#))
- multi-20416** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfInSpeciesTypeBonds** container object may only contain **InSpeciesTypeBond** objects. (References: [Section 3.8.5 on page 15.](#))
- multi-20417** ✓ A **ListOfInSpeciesTypeBonds** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfInSpeciesTypeBonds** object. (References: [Section 3.8.5 on page 15.](#))

## Rules for BindingSiteSpeciesType objects

- multi-20501** ✓ A **BindingSiteSpeciesType** object is not permitted to have any **ListOfSpeciesTypeInstances** subobject. (References: [Section 3.8.7 on page 15.](#))

## Rules for SpeciesFeatureType objects

- multi-20601** ✓ A **SpeciesFeatureType** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesFeatureType** object. (References: [Section 3.9 on page 16.](#))
- multi-20602** ✓ A **SpeciesFeatureType** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesFeatureType** object. (References: [Section 3.9 on page 16.](#))
- multi-20603** ✓ A **SpeciesFeatureType** object must have the required attributes **multi:id** and **multi:occur**, and may have the optional attribute **multi:name**. No other attributes from the Multi namespace are permitted on a **SpeciesFeatureType** object. (References: [Section 3.9 on page 16.](#))
- multi-20604** ✓ The value of the **multi:occur** attribute on a given **SpeciesFeatureType** object must conform to the syntax of the SBML data type **positiveInteger**. (References: [Section 3.9.2 on page 16.](#))
- multi-20605** ✓ One **ListOfPossibleSpeciesFeatureValues** subobject in a **SpeciesFeatureType** object is required. (References: [Section 3.9.3 on page 16.](#))
- multi-20606** ✓ A **ListOfPossibleSpeciesFeatureValues** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfPossibleSpeciesFeatureValues** object. (References: [Section 3.9.3 on page 16.](#))
- multi-20607** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfPossibleSpeciesFeatureValues** container object may only contain **PossibleSpeciesFeatureValue** objects. (References: [Section 3.9.3 on page 16.](#))
- multi-20608** ✓ A **ListOfPossibleSpeciesFeatureValues** object must not be empty. (References: [Section 3.9.3 on page 16.](#))

## Rules for PossibleSpeciesFeatureValue objects

- multi-20701** ✓ A **PossibleSpeciesFeatureValue** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted.

ted on a **PossibleSpeciesFeatureValue** object. (References: [Section 3.10 on page 17](#)).

- multi-20702** ✓ A **PossibleSpeciesFeatureValue** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **PossibleSpeciesFeatureValue** object. (References: [Section 3.10 on page 17](#)).
- multi-20703** ✓ A **PossibleSpeciesFeatureValue** object must have the required attribute **multi:id**, and may have the optional attributes **multi:name** and **multi:numericValue**. No other attributes from the Multi namespace are permitted on a **PossibleSpeciesFeatureValue** object. (References: [Section 3.10 on page 17](#).)
- multi-20704** ✓ The value of the **multi:numericValue** attribute on a given **PossibleSpeciesFeatureValue** object must be the identifier of a **Parameter** object defined in the same **Model** object. (References: [Section 3.10.2 on page 17](#).)

## Rules for SpeciesTypeInstance objects

- multi-20801** ✓ A **SpeciesTypeInstance** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeInstance** object. (References: [Section 3.11 on page 18](#)).
- multi-20802** ✓ A **SpeciesTypeInstance** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeInstance** object. (References: [Section 3.11 on page 18](#)).
- multi-20803** ✓ A **SpeciesTypeInstance** object must have the required attributes **multi:id** and **multi:speciesType**, and may have the optional attributes **multi:name** and **multi:compartmentReference**. No other attributes from the Multi namespace are permitted on a **SpeciesTypeInstance** object. (References: [Section 3.11 on page 18](#).)
- multi-20805** ✓ The value of the **multi:speciesType** attribute on a given **SpeciesTypeInstance** object must be the identifier of a **SpeciesType** object defined in the same **Model** object. (References: [Section 3.11.2 on page 18](#).)
- multi-20806** ✓ The value of the **multi:compartmentReference** attribute, if present on a given **SpeciesTypeInstance** object, must be the identifier of a **CompartmentReference** object defined in the same **Model** object. (References: [Section 3.11.3 on page 18](#).)

## Rules for SpeciesTypeComponentIndex objects

- multi-20901** ✓ A **SpeciesTypeComponentIndex** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeComponentIndex** object. (References: [Section 3.12 on page 20](#)).
- multi-20902** ✓ A **SpeciesTypeComponentIndex** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeComponentIndex** object. (References: [Section 3.12 on page 20](#)).
- multi-20903** ✓ A **SpeciesTypeComponentIndex** object must have the required attributes **multi:id** and **multi:compartment**, and may have the optional attributes **multi:name** and **multi:identifyingParent**. No other attributes from the Multi namespace are permitted on a **SpeciesTypeComponentIndex** object. (References: [Section 3.12 on page 20](#).)
- multi-20904** ✓ The value of the **multi:component** attribute on a given **SpeciesTypeComponentIndex** object must be the identifier of a **SpeciesTypeInstance** object, or a **SpeciesTypeComponentIndex** object under the **SpeciesType** object that this **SpeciesTypeComponentIndex** object belongs to, or the **SpeciesType** object itself. (References: [Section 3.12.2 on page 20](#).)

- multi-20907** ✓ The value of the `multi:identifyingParent` attribute on a given **SpeciesTypeComponentIndex** object must be the identifier of a `component` object under the **SpeciesType** object that this **SpeciesTypeComponentIndex** object belongs to. A `component` object can be an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType**. (References: [Section 3.12.3 on page 20.](#))

## Rules for InSpeciesTypeBond objects

- multi-21101** ✓ An **InSpeciesTypeBond** object may have the optional SBML Level 3 Core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace are permitted on an **InSpeciesTypeBond** object. (References: [Section 3.13 on page 23.](#))
- multi-21102** ✓ An **InSpeciesTypeBond** object may have the optional SBML Level 3 Core subobjects for `notes` and `annotation`. No other elements from the SBML Level 3 Core namespace are permitted on an **InSpeciesTypeBond** object. (References: [Section 3.13 on page 23.](#))
- multi-21103** ✓ An **InSpeciesTypeBond** object must have the required attributes, `multi:bindingSite1` and `multi:bindingSite2`, and may have the optional attributes, `multi:id` and `multi:name`. No other attributes from the Multi namespace are permitted on an **InSpeciesTypeBond** object. (References: [Section 3.13 on page 23.](#))
- multi-21104** ✓ The value of the `multi:bindingSite1` attribute on a given **InSpeciesTypeBond** object must be the identifier of a **SpeciesTypeInstance** object or **SpeciesTypeComponentIndex** which ultimately reference a object of **BindingSiteSpeciesType**. (References: [Section 3.13.2 on page 23.](#))
- multi-21105** ✓ The value of the `multi:bindingSite2` attribute on a given **InSpeciesTypeBond** object must be the identifier of a **SpeciesTypeInstance** object or **SpeciesTypeComponentIndex** which ultimately reference a object of **BindingSiteSpeciesType**. (References: [Section 3.13.2 on page 23.](#))
- multi-21106** ✓ The `multi:bindingSite1` and `multi:bindingSite2` attributes must not reference the same **BindingSiteSpeciesType** object. (References: [Section 3.13.2 on page 23.](#))

## Rules for extended Species objects

- multi-21201** ✓ A **Species** object may have the optional attribute, `multi:speciesType`. No other attributes from the Multi namespace are permitted on a **Species** object. (References: [Section 3.15 on page 26.](#))
- multi-21202** ✓ The value of a `multi:speciesType` attribute, if present on a **Species** object, must be the identifier of a **SpeciesType** object. (References: [Section 3.15.1 on page 26.](#))
- multi-21203** ✓ Two `ListOf__` subobjects with a **Species** object are optional, but if present, these container object must not be empty. Specifically, if any of the following two classes of objects are present on the **Species** object, it must not be empty: **ListOfOutwardBindingSites** and **ListOfSpeciesFeatures**. (References: [Section 3.15 on page 26.](#))
- multi-21204** ✓ A **ListOfOutwardBindingSites** object may have the optional SBML core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfOutwardBindingSites** object. (References: [Section 3.15.2 on page 26.](#))
- multi-21205** ✓ Apart from the general `notes` and `annotation` subobjects permitted on all SBML objects, a **ListOfOutwardBindingSites** container object may only contain **OutwardBindingSite** objects. (References: [Section 3.15.2 on page 26.](#))
- multi-21206** ✓ A **ListOfSpeciesFeatures** object may have the optional SBML core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesFeatures** object. (References: [Section 3.15.3 on page 27.](#))

- multi-21207** ✓ A **SubListOfSpeciesFeatures** object may have the optional attributes **multi:id**, **multi:name**, **multi:component**, and the required attribute **multi:relation**. No other attributes from the Multi namespace are permitted on a **SubListOfSpeciesFeatures** object. (References: [Section 3.17 on page 29.](#))
- multi-21208** ✓ The value of the **multi:relation** attribute, if presented on a **SubListOfSpeciesFeatures** object, must conform to the syntax of the Multi data type **Relation**. (References: [Section 3.17.2 on page 30.](#))
- multi-21209** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfSpeciesFeatures** container object may only contain **SpeciesFeature** and/or **SubListOfSpeciesFeatures** objects. (References: [Section 3.15.3 on page 27.](#))
- multi-21210** ✓ A **SubListOfSpeciesFeatures** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SubListOfSpeciesFeatures** object. (References: [Section 3.17 on page 29.](#))
- multi-21211** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **SubListOfSpeciesFeatures** container object may only contain **SpeciesFeature** objects. (References: [Section 3.17 on page 29.](#))
- multi-21212** ✓ The value of the **multi:component** attribute on a given **SubListOfSpeciesFeatures** object must be the identifier of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType** which contains the **SpeciesFeature** objects in this **subListOfSpeciesFeatures**. (References: [Section 3.17.3 on page 30.](#))
- multi-21213** ✓ A **species** must have its **speciesType** attribute defined when it has a **listOfOutwardBindingSites**. (References: [Section 3.15 on page 26.](#))
- multi-21214** ✓ A **species** must have its **speciesType** attribute defined when it has a **listOfSpeciesFeatures**. (References: [Section 3.15 on page 26.](#))
- multi-21215** ✓ The **relation** attribute of a **subListOfSpeciesFeatures** can only have the value “and” if any **speciesFeature** involved references a **speciesFeatureType** with “**occur** > 1”. (References: [Section 3.17.2 on page 30.](#))
- multi-21216** ✓ A **SubListOfSpeciesFeatures** object must have at least two **speciesFeatures**. (References: [Section 3.17 on page 29.](#))

## Rules for **OutwardBindingSite** objects

- multi-21301** ✓ An **OutwardBindingSite** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on an **OutwardBindingSite** object. (References: [Section 3.16 on page 28.](#))
- multi-21302** ✓ An **OutwardBindingSite** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on an **OutwardBindingSite** object. (References: [Section 3.16 on page 28.](#))
- multi-21303** ✓ An **OutwardBindingSite** object must have the required attributes, **multi:bindingStatus** and **multi:component**, and may have the optional attributes **multi:id** and **multi:name**. No other attributes from the Multi namespace are permitted on an **OutwardBindingSite** object. (References: [Section 3.16 on page 28.](#))

- multi-21304** ✓ The value of the `multi:bindingStatus` attribute on a given **OutwardBindingSite** object must conform to the syntax of the Multi data type `BindingStatus`. (References: [Section 3.16.2 on page 28.](#))
- multi-21305** ✓ The value of the `multi:component` attribute on a given **OutwardBindingSite** object must be the identifier of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType** which ultimately reference an object of **BindingSiteSpeciesType**. (References: [Section 3.16.3 on page 28.](#))
- multi-21306** ✓ An `outwardBindingSite` cannot be a binding site referenced by any `inSpeciesTypeBond` in the `species`. (References: [Section 3.16.3 on page 28.](#))

## Rules for SpeciesFeature objects

- multi-21401** ✓ A **SpeciesFeature** object may have the optional SBML Level 3 Core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesFeature** object. (References: [Section 3.18 on page 30.](#))
- multi-21402** ✓ A **SpeciesFeature** object may have the optional SBML Level 3 Core subobjects for `notes` and `annotation`. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesFeature** object. (References: [Section 3.18 on page 30.](#))
- multi-21403** ✓ A **SpeciesFeature** object must have the required attributes, `multi:speciesFeatureType` and `multi:occur`, and may have the optional attributes, `multi:id`, `multi:name`, and `multi:component`. No other attributes from the Multi namespace are permitted on a **SpeciesFeature** object. (References: [Section 3.18 on page 30.](#))
- multi-21404** ✓ The value of the `multi:speciesFeatureType` attribute on a given **SpeciesFeature** object must be the identifier of a **SpeciesFeatureType** object which is in the **SpeciesType** object referenced by the **Species** object containing this **SpeciesFeature** object. (References: [Section 3.18.2 on page 31.](#))
- multi-21405** ✓ The value of the `multi:occur` attribute on a given **SpeciesFeature** object must conform to the syntax of the SBML data type `positiveInteger`. The value of the `multi:occur` attribute must not be larger than that of the `multi:occur` attribute of the **SpeciesFeatureType** object referenced by this **SpeciesFeature** object. (References: [Section 3.18.3 on page 31.](#))
- multi-21406** ✓ The value of the `multi:component` attribute on a given **SpeciesFeature** object must be the identifier of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType** which contains this **SpeciesFeature** object. (References: [Section 3.18.4 on page 31.](#))
- multi-21407** ✓ One and only one **ListOfSpeciesFeatureValues** subobject within a **SpeciesFeature** object is required. (References: [Section 3.18.5 on page 31.](#))
- multi-21408** ✓ A **ListOfSpeciesFeatureValues** object must not be empty. (References: [Section 3.18.5 on page 31.](#))
- multi-21409** ✓ A **ListOfSpeciesFeatureValues** object may have the optional SBML core attributes `metaid` and `sboTerm`. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesFeatureValues** object. (References: [Section 3.18.5 on page 31.](#))
- multi-21410** ✓ Apart from the general `notes` and `annotation` subobjects permitted on all SBML objects, a **ListOfSpeciesFeatureValues** container object may only contain **SpeciesFeatureValue** objects. (References: [Section 3.18.5 on page 31.](#))

## Rules for SpeciesFeatureValue objects

- multi-21501** ✓ A **SpeciesFeatureValue** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesFeatureValue** object. (References: [Section 3.18.6 on page 31](#)).
- multi-21502** ✓ A **SpeciesFeatureValue** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesFeatureValue** object. (References: [Section 3.18.6 on page 31](#)).
- multi-21503** ✓ A **SpeciesFeatureValue** object must have the required attribute **multi:value**. No other attributes from the Multi namespace are permitted on a **SpeciesFeatureValue** object. (References: [Section 3.18.6 on page 31](#).)
- multi-21504** ✓ The value of the **multi:value** attribute on a given **SpeciesFeatureValue** object must be the identifier of a **PossibleSpeciesFeatureValue** object defined in the **SpeciesFeatureType** object referenced by the **SpeciesFeature** object containing this **SpeciesFeatureValue** object. (References: [Section 3.18.6 on page 31](#).)

## Rules for IntraSpeciesReaction objects

- multi-21601** ✓ An **IntraSpeciesReaction** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace and the Multi namespace are permitted on an **IntraSpeciesReaction** object. (References: [Section 3.21 on page 35](#)).
- multi-21602** ✓ An **IntraSpeciesReaction** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on an **IntraSpeciesReaction** object. (References: [Section 3.21 on page 35](#)).

## Rules for extended SimpleSpeciesReference objects

- multi-21701** ✓ An extended **SimpleSpeciesReference** object may have the optional attribute, **multi:compartmentReference**. No other attributes from the Multi namespace are permitted on a **SimpleSpeciesReference** object. (References: [Section 3.22 on page 36](#).)
- multi-21702** ✓ The value of a **multi:compartmentReference** attribute, if present on a **SimpleSpeciesReference** object, must be the identifier of a **CompartmentReference** object. (References: [Section 3.22 on page 36](#).)

## Rules for extended SpeciesReference objects

- multi-21801** ✓ A **ListOfSpeciesTypeComponentMapsInProduct** object within an extended **SpeciesReference** object is optional, but if present, must not be empty. (References: [Section 3.23.1 on page 38](#).)
- multi-21802** ✓ A **ListOfSpeciesTypeComponentMapsInProduct** object may have the optional SBML core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace or the Multi namespace are permitted on a **ListOfSpeciesTypeComponentMapsInProduct** object. (References: [Section 3.23.1 on page 38](#).)
- multi-21803** ✓ Apart from the general **notes** and **annotation** subobjects permitted on all SBML objects, a **ListOfSpeciesTypeComponentMapsInProduct** container object may only contain **Species-TypeComponentMapInProduct** objects. (References: [Section 3.23.1 on page 38](#).)

## Rules for SpeciesTypeComponentMapInProduct objects

- multi-21901** ✓ A **SpeciesTypeComponentMapInProduct** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeComponentMapInProduct** object. (References: [Section 3.24 on page 39](#)).
- multi-21902** ✓ A **SpeciesTypeComponentMapInProduct** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **SpeciesTypeComponentMapInProduct** object. (References: [Section 3.24 on page 39](#)).
- multi-21903** ✓ A **SpeciesTypeComponentMapInProduct** object must have the required attributes **multi:reactant**, **multi:reactantComponent**, and **multi:productComponent**, and may have the optional attributes **multi:id** and **multi:name**. No other attributes from the Multi namespace are permitted on a **SpeciesTypeComponentMapInProduct** object. (References: [Section 3.24 on page 39](#).)
- multi-21904** ✓ The value of the **multi:reactant** attribute on a given **SpeciesTypeComponentMapInProduct** object must be the identifier of a reactant **SpeciesReference** object within a reaction. (References: [Section 3.24.2 on page 39](#).)
- multi-21905** ✓ The value of the **multi:reactantComponent** attribute on a given **SpeciesTypeComponentMapInProduct** object must be the identifier of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType**. (References: [Section 3.24.3 on page 39](#).)
- multi-21906** ✓ The value of the **multi:productComponent** attribute on a given **SpeciesTypeComponentMapInProduct** object must be the identifier of an object of **SpeciesTypeInstance**, **SpeciesTypeComponentIndex** or **SpeciesType**. (References: [Section 3.24.4 on page 39](#).)

## Rules for CompartmentReference objects

- multi-22001** ✓ A **CompartmentReference** object may have the optional SBML Level 3 Core attributes **metaid** and **sboTerm**. No other attributes from the SBML Level 3 Core namespace are permitted on a **CompartmentReference** object. (References: [Section 3.6 on page 13](#)).
- multi-22002** ✓ A **CompartmentReference** object may have the optional SBML Level 3 Core subobjects for **notes** and **annotation**. No other elements from the SBML Level 3 Core namespace are permitted on a **CompartmentReference** object. (References: [Section 3.6 on page 13](#)).
- multi-22003** ✓ A **CompartmentReference** object must have the required attribute **multi:compartment**, and may have the optional attributes **multi:id** and **multi:name**. No other attributes from the Multi namespace are permitted on a **CompartmentReference** object. (References: [Section 3.6 on page 13](#).)
- multi-22004** ✓ The value of the **multi:compartment** attribute must be the value of an **id** attribute on an existing **Compartment** object in the SId namespace of the parent **Model**. (References: [Section 3.6 on page 13](#).)
- multi-22005** ✓ If some or all **CompartmentReference** objects within a **ListOfCompartmentReferences** object reference the same **Compartment** object, those **compartmentReferences** are required to have its **multi:id** attribute defined. (References: [Section 3.6.1 on page 13](#).)
- multi-22006** ✓ A **compartmentReference** cannot reference a **compartment** that directly or indirectly contains the **compartmentReference**. (References: [Section 3.6.2 on page 13](#).)
