7-Chloro-4-phenethyl-2*H*-1,4-benzoxazin-3(*4H*)-one

M.-J. Chen, H. Yang, W.-L. Dong, H. Zuo and J.-Z. Zhou

Comment

As part of our continuing project on the study of the interactions occurring between small molecules and proteins (Li *et al.*, 2008; Zuo *et al.*, 2008), we report here the synthesis and crystal structure of the title compound. In the crystal structure, the two ring systems are nearly coplanar, the diehedral angle between the aromatic rings being 4.2 (2)°.

Experimental

To the solution of 2-(2,4-dichlorophenoxy)-*N*-phenethylacetamide (0.684 g, 2.0 mmol) in DMF (20 ml), caesium carbonate (0.787 g, 2.4 mmol) was added. The mixture was refluxed for 1.5 h. After completion of the reaction (by TLC monitoring), the DMF was removed under vacuum. Water (20 ml) was added into the residue to obtain a turbid solution and it was extracted by ethyl acetate (20 ml *x* 4). The combined organic layers were washed three times with 10 mL of 1 mol/L hydrochloric acid and saturated sodium chloride solution (10 ml *x* 3), dried over MgSO₄. And then the mixture was filtered and the filtrate obtained was concentrated under reduced pressure to obtain the corresponding crude product. The product was purified by column chromatography on silica gel using ethyl/acetate = 1/5 as eluent (yield 75%). Crystals suitable for X-ray diffraction were obtained by slow evaporation of a solution of the solid dissolved in ethyl acetate/hexane at room temperature for 10 days.

Refinement

All H atoms were placed in calculated positions and refined as riding, with C—H = 0.93–0.97 Å, and with U_{iso}(H)=1.2Ueq(C). The absolute structure was determined on the basis of 797 Friedel pairs.

Refinement

Refinement on F^2	H-atom parameters constrained
Least-squares matrix: full	$w = 1/[\sigma^2(F_o^2) + (0.04P)^2 + 1.1309P]$ where $P = (F_o^2 + 2F_c^2)/3$
$R[F^2 > 2\sigma(F^2)] = 0.049$	$(\Delta/\sigma)_{\text{max}} < 0.001$
$wR(F^2) = 0.117$	$\Delta\rho_{\text{max}} = 0.15 \text{ e \AA}^{-3}$
$S = 1.00$	$\Delta\rho_{\text{min}} = -0.16 \text{ e \AA}^{-3}$
2171 reflections	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$
182 parameters	Extinction coefficient: 0.0057 (5)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 797 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.04 (13)
Hydrogen site location: inferred from neighbouring sites	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large

as those based on F , and R -factors based on ALL data will be even larger. The absolute structure was determined on the basis of 800 Friedel pairs.
