In the title compound, $C_{13}H_9Cl_2N_3O_2$, the 2,6-dichlorophenyl ring and the nitro-substituted benzene ring form a dihedral angle of $21.16(14)^\circ$. In the crystal, face-to-face $\pi-\pi$ stacking interactions occur along the *a*-axis direction between the centroids of the 2,6-dichlorophenyl ring and the nitro-substituted benzene ring. Furthermore, these molecules show intramolecular N—H···Cl and C—H···O contacts and are linked by intermolecular N—H···O and C—H···Cl hydrogen bonds, forming pairs of hydrogen-bonded molecular layers parallel to $(\bar{2}\bar{0}\bar{2})$. The Hirshfeld surface analysis of the crystal structure indicates that the most important contributions to the crystal packing are from H···H (23.0%), O···H/H···O (20.1%), Cl···H/H···Cl (19.0%), C···C (11.2%) and H···C/C···H (8.0%) interactions.

1. Chemical context

Arylhydrazones and their complexes have attracted much attention because of their high synthetic potential for organic and inorganic chemistry and diverse useful properties (Maharramov *et al.*, 2009, 2010, 2018; Mahmudov *et al.*, 2010, 2011, 2014*a*). The analytical and catalytic properties of this class of compounds are strongly dependent on the attached groups to the hydrazone moiety (Mahmudov *et al.*, 2013; Shikaliyev *et al.*, 2018, 2019). On the other hand, intermolecular interactions organize the molecular architectures, which play a critical role in synthesis, catalysis, micellization, etc. (Akbari Afkhami *et al.*, 2017; Gurbanov *et al.*, 2017, 2018; Kopylovich *et al.*, 2011*a,b*; Ma *et al.*, 2017*a,b*; Mahmoudi *et al.*, 2016, 2017*a,b,c*, 2018*a,b*). New types of non-covalent bonds such as halogen, chalcogen, pnictogen and tetrel bonds or their cooperation with hydrogen bonds are able to contribute to the synthesis and catalysis, giving materials with improved properties (Mahmudov *et al.*, 2013, 2014*b*, 2015, 2017*a,b*, 2019; Mizar *et al.*, 2012; Shikaliyev *et al.*, 2013, 2014). For that, the main skeleton of the hydrazone ligand should be decorated by non-covalent bond donor centre(s). In a continuation of our work in this regard, we have functionalized a new azo dye, (*E*)-1-(2,6-dichlorophenyl)-2-(2-nitrobenzylidene)hydrazine, which provides intermolecular non-covalent interactions.

2. Structural commentary

The title molecule (Fig. 1) has an *E* configuration about the $\text{C}\equiv\text{N}$ bond. The 2,6-dichlorophenyl ring and the nitro-substituted benzene ring of the title compound are inclined at $21.16(14)^\circ$, while the nitro group is skewed out of the attached benzene ring plane by $27.06(18)^\circ$. The $\text{Cl}_1-\text{C}_2-\text{C}_1-\text{N}_1$, $\text{Cl}_2-\text{C}_6-\text{C}_1-\text{N}_1$, $\text{C}_2-\text{C}_1-\text{N}_1-\text{N}_2$, $\text{C}_1-\text{N}_1-\text{N}_2-\text{C}_7$, $\text{N}_1-\text{N}_2-\text{C}_7-\text{C}_8$, $\text{N}_2-\text{C}_7-\text{C}_8-\text{C}_{13}$, $\text{C}_7-\text{C}_8-\text{C}_{13}-\text{N}_3$, $\text{C}_8-\text{C}_{13}-\text{N}_3-\text{O}_1$ and $\text{C}_8-\text{C}_{13}-\text{N}_3-\text{O}_2$ torsion angles are $0.1(3)$, $4.7(4)$, $-145.8(2)$, $176.7(2)$, $175.4(2)$, $164.3(3)$, $-7.7(4)$, $-26.9(4)$ and $155.7(3)^\circ$, respectively. Two intramolecular $\text{N}-\text{H}\cdots\text{Cl}$ and $\text{C}-\text{H}\cdots\text{O}$ contacts are present (Table 1).

3. Supramolecular features and Hirshfeld surface analysis

In the crystal, face-to-face $\pi\cdots\pi$ stacking interactions [$\text{Cg}_1\cdots\text{Cg}_2(\frac{1}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z) = 3.7605(17)\text{\AA}$ with slippage of 1.352\AA , $\text{Cg}_1\cdots\text{Cg}_2(\frac{3}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z) = 3.8010(17)\text{\AA}$ with slippage of 1.457\AA , where Cg_1 and Cg_2 are the centroids of the $\text{C}_1\text{--C}_6$ and $\text{C}_8\text{--C}_{13}$ rings, respectively] occur between the centroids of the 2,6-dichlorophenyl ring and the nitro-substituted benzene ring of the title molecule along the *a*-axis direction (Figs. 2 and 3). Furthermore, these molecules are linked by intermolecular $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{Cl}$ hydrogen bonds, forming pairs of hydrogen-bonded molecular layers parallel to (202) (Tables 1 and 2; Figs. 4 and 5). There is also a $\text{C}-\text{Cl}\cdots\text{Cg}$ interaction [$\text{Cl}_1\cdots\text{Cg}_2(\frac{3}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z) =$

Hirshfeld surface analysis was used to analyse the various intermolecular interactions in the title compound, through mapping the normalized contact distance (d_{norm}) using *CrystalExplorer* (Turner *et al.*, 2017; Spackman & Jayatilaka, 2009). The Hirshfeld surface mapped over d_{norm} using a standard surface resolution with a fixed colour scale of -0.1980 (red) to

1.3500 (blue) a.u. is shown in Fig. 6. The white surface indicates contacts with distances equal to the sum of van der Waals radii, and the red and blue colours indicate distances shorter (in close contact) or longer (distant contact) than the van der Waals radii, respectively (Venkatesan *et al.*, 2016). The dark-red spots on the d_{norm} surface arise as a result of short interatomic contacts (Table 2), while the other weaker intermolecular interactions appear as light-red spots. The red points, which represent closer contacts and negative d_{norm} values on the surface, correspond to the C–H \cdots O and C–H \cdots Cl interactions. The shape-index of the Hirshfeld surface is a tool for visualizing the π – π stacking by the presence of adjacent red and blue triangles; if there are no such triangles, then there are no π – π interactions. The plot of the Hirshfeld surface mapped over shape-index shown in Fig. 7 clearly suggests that there are π – π interactions in the crystal packing of the title compound.

O···N/N···O	0.1

The percentage contributions of various contacts to the total Hirshfeld surface are listed in Table 3 and shown in the two-dimensional fingerprint plots in Fig. 8. As revealed by the two-dimensional fingerprint plots (Fig. 8), the crystal packing is dominated by H···H contacts, representing van der Waals interactions (23.0% contribution to the overall surface), followed by O···H and Cl···H interactions, which contribute 20.1% and 19.0%, respectively.

4. Database survey

Six compounds closely resemble the title compound, *viz.*, 1-(2,4-dinitrophenyl)-2-[*(E*)-(3,4,5-trimethoxybenzylidene)-hydrazine] (CSD refcode GISJAV; Chantrapromma *et al.*, 2014), (*E*)-1-(2,4-dinitrophenyl)-2-[1-(3-methoxyphenyl)ethylidene]hydrazine (XEBCEO; Fun *et al.*, 2012), 1-(2,4-dinitrophenyl)-2-[*(E*)-2,4,5-trimethoxybenzylidene]hydrazine (AFUSEB; Fun *et al.*, 2013), (*E*)-1-(2,4-dinitrophenyl)-2-(1-(2-methoxyphenyl)ethylidene)hydrazine (OBUJAY; Fun *et al.*, 2011), (*E*)-1-(2,4-dinitrophenyl)-2-[1-(3-fluorophenyl)ethylidene]hydrazine (PAVKA; Chantrapromma *et al.*, 2012) and (*E*)-1-(2,4-dinitrophenyl)-2-[1-(2-nitrophenyl)ethylidene]-hydrazine (YAHRUW; Nilwanna *et al.*, 2011). All bond lengths (Allen *et al.*, 1987) and angles for the title compound are within normal ranges and are comparable to those observed in these structures. In each one, the configuration of the imine C=N bond is *E*.

5. Synthesis and crystallization

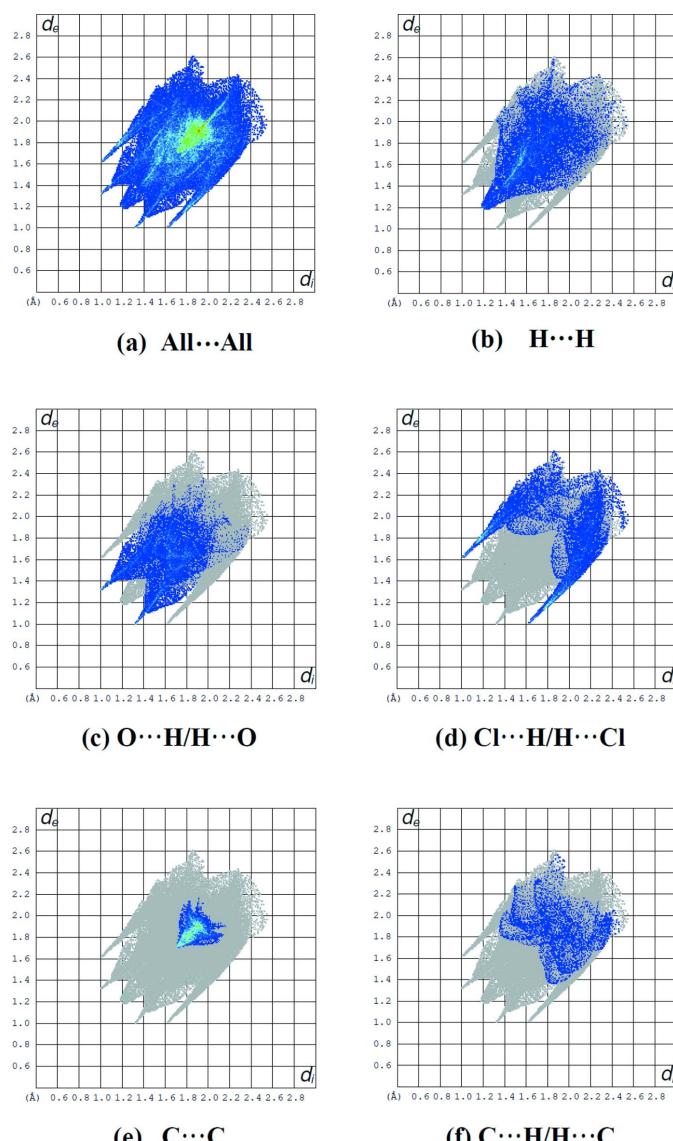

The title compound was synthesized according to the reported method (Atioğlu *et al.*, 2019; Maharramov *et al.*, 2018; Shixaliyev *et al.*, 2018, 2019). A mixture of 2-nitrobenzaldehyde (10 mmol), CH₃COONa (0.82 g), ethanol (50 mL) and (2,6-dichlorophenyl)hydrazine (10.2 mmol) was refluxed at 353 K under stirring for 2 h. The reaction mixture was cooled to room temperature and water (50 mL) was added to give a precipitate of the crude product, which was filtered off, washed with diluted ethanol (1:1 with water) and dried *in vacuo* using

a rotary evaporator. Crystals suitable for X-ray analysis were obtained by slow evaporation of an ethanol solution.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
