The title compound,  $C_8H_8O_2S_2$ , contains a cyclohexane-1,3-dione ring, which has a twist-boat conformation. The  $C_2S_2$  ring is close to planar (r.m.s. deviation = 0.023 Å) and the dihedral angle between the mean planes of the cyclohexane and 1,3-dithietane rings is 9.1 (3)°. Short intramolecular S···O contacts occur [2.719 (5) and 2.740 (5) Å]. In the crystal, the molecules are linked by weak C—H···S hydrogen bonds and short [3.165 (5) Å] S···O contacts, forming (010) layers. The prevalence of these interactions is illustrated by an analysis of the three-dimensional Hirshfeld surface and by two-dimensional fingerprint plots.

## 1. Chemical context

Ketene dithioacetals are useful intermediates in organic synthesis and have been used for the preparation of heterocyclic compounds (Kolb, 1990; Ila *et al.*, 2001). The synthesis of trifluoromethyl ketene dithioacetals has applications in the field of pharmaceuticals and agrochemicals (Gouault-Bironneau *et al.*, 2012; Timoshenko & Portella, 2009). The functionalization of ketene dithioacetals provides more powerful tools for the development of new intermediates (Wang *et al.*, 2011; Gao *et al.*, 2010; Hu *et al.*, 2012). The direct formation of a C—C bond has been carried out by reacting a cyano ketene dithioacetal and Morita–Baylis–Hillman (MBH) alcohols resulting from the reaction of acrylonitrile and aryl aldehydes. This reaction led to the corresponding 1,4-pentadiene derivatives (Zhao *et al.*, 2007). Fiala *et al.* (2007) have studied the inhibitive action of some synthetic ketene dithioacetal derivatives towards the corrosion of copper in aerated nitric acid solutions. They concluded that these compounds are good inhibitors of copper corrosion in this medium. In the present study, we report the synthesis, crystal structure and Hirshfeld surface analysis of the new title 1,3-dithian-2-ylidene derivative,  $C_8H_8O_2S_2$ , (I).

## 2. Structural commentary

In the molecular structure of (I), the cyclohexane and dithietane rings are linked by a C=C bond of 1.364 (8) Å (Fig. 1). The cyclohexane-1,3-dione ring adopts a twist-boat

**Table 1**  
Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ ).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
$\text{C}5-\text{H}5\text{A}\cdots \text{S}2^{\text{i}}$	0.97	2.87	3.844 (8)	178

Symmetry code: (i)  $-x, -y + 2, z - \frac{1}{2}$ .

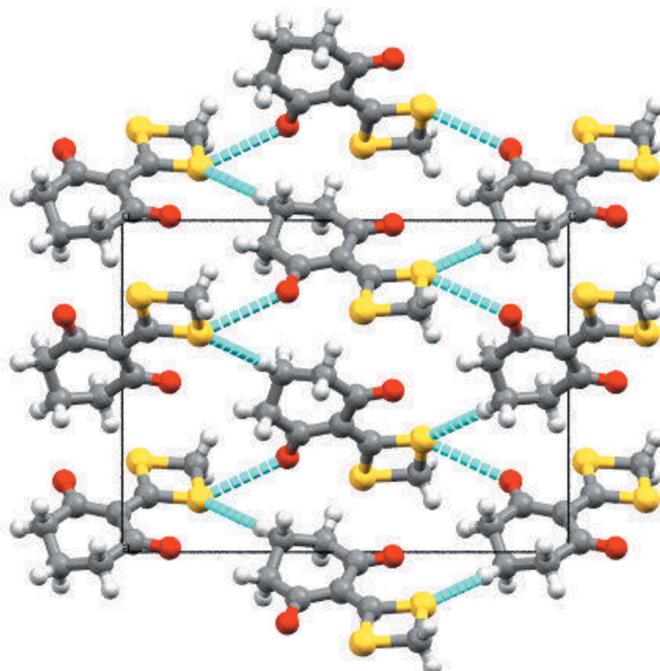

conformation, as seen in related compounds (Kuppan Chandrakha *et al.*, 2016; Liu *et al.*, 2011). Atom C5 is displaced by 0.627 (8)  $\text{\AA}$  with respect to the C2/C3/C4/C6/C7 mean plane, similar to the value observed for 2-[chloro(4-methoxyphenyl)methyl]-2-(4-methoxyphenyl)-5,5-dimethylcyclohexane-1,3-dione (Saloua Chelli *et al.*, 2016). The largest endocyclic angle in the cyclohexane ring [ $\text{C}7-\text{C}2-\text{C}3 = 123.2 (6)^\circ$ ] is located opposite the dithietan ring and the largest exo-cyclic angle ( $\text{C}6-\text{C}7-\text{O}2$ ) is  $122.3 (5)^\circ$ . A difference of  $1.3^\circ$  is observed between the angles located on either side of the  $\text{C}1=\text{C}2$  double bond. In the  $\text{C}_2\text{S}_2$  ring, the  $\text{C}1-\text{S}1$  and  $\text{C}1-\text{S}2$  bond lengths are indistinguishable at  $1.716 (6) \text{\AA}$  whereas the  $\text{C}8-\text{S}1$  and  $\text{C}8-\text{S}2$  bond lengths differ slightly [ $1.819 (7)$  and  $1.801 (7) \text{\AA}$ , respectively]. The molecule has local  $C_s$  symmetry with a non-crystallographic mirror plane passing through atoms C8, C1, C2 and C5. The dihedral angle between the cyclohexane (all atoms) and dithietane rings is  $9.1 (3)^\circ$  and short intramolecular  $\text{S}1\cdots\text{O}2$  [ $2.719 (5) \text{\AA}$ ] and  $\text{S}2\cdots\text{O}1$  [ $2.740 (5) \text{\AA}$ ] contacts are observed (Fig. 1).

### 3. Supramolecular features

In the crystal, the molecules stack head-to-tail along the  $b$ -axis direction. The molecules are linked by  $\text{C}5-\text{H}5\text{A}\cdots \text{S}2$  hydrogen bonds (Table 1) and short [3.165 (5)  $\text{\AA}$  compared to a van der Waals separation of  $3.32 \text{\AA}$ ]  $\text{S}2\cdots\text{O}2^{\text{ii}}$  [symmetry code: (ii)  $\frac{1}{2}-x, y, \frac{1}{2}+z$ ] contacts, forming (010) layers (Fig. 2).

### 4. Hirshfeld surface analysis

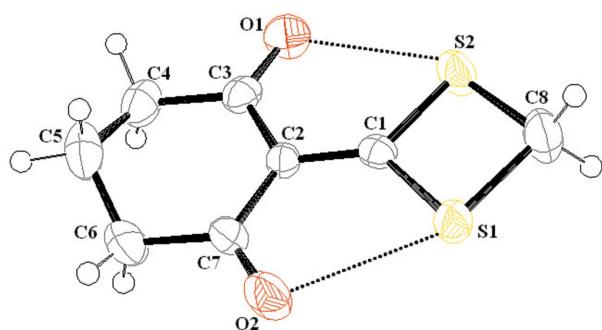

The nature of the intermolecular interactions in (I) has been computed by *CrystalExplorer* 17.5 (Turner *et al.*, 2017), using Hirshfeld surface (HS) analysis (Spackman & Jayatilaka, 2009) and two-dimensional fingerprint plots (McKinnon *et al.*, 2007). The  $d_{\text{norm}}$  plot (Fig. 3) shows red spots corresponding to

**Figure 2**

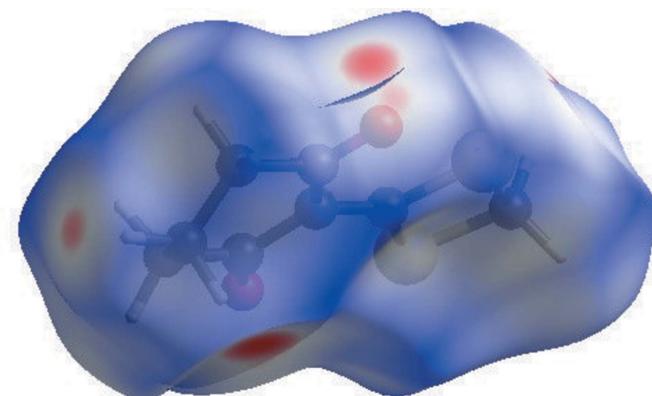

Structure of (I) viewed along the [010] direction, showing the infinite layers propagating parallel to the  $ac$  plane. The  $\text{C}-\text{H}\cdots \text{S}$  and short  $\text{S}\cdots \text{O}$  contacts are shown as blue dashed lines.

the  $\text{C}5-\text{H}5\text{A}\cdots \text{S}2$  hydrogen bond and short  $\text{S}2\cdots \text{O}2$  contact. A list of the relative percentage contributions of the close contacts to the HS of (I) are given in Table 2 and the overall two-dimensional fingerprint plot is shown in Fig. 4a. A contribution of 30.7% was found for the  $\text{H}\cdots \text{O}/\text{O}\cdots \text{H}$  interactions, representing the largest contribution; these contacts are represented by the spikes in the top left ( $d_e > d_i$ ,  $\text{H}\cdots \text{O}$ , 14.3%) and bottom right ( $d_e < d_i$ ,  $\text{O}\cdots \text{H}$ , 16.5%) of Fig. 4b. Interactions of the type  $\text{H}\cdots \text{H}$  appear in the middle of the scattered points in the fingerprint plots with a pair of spikes at  $d_e + d_i = 2.5 \text{\AA}$  and comprise 25.9% of the entire surface (Fig. 4c); the van der Waals radius for this interaction is  $2.4 \text{\AA}$ , which means it is a weak interaction. The  $\text{S}\cdots \text{H}/\text{H}\cdots \text{S}$  contacts (Fig. 4d), which account for 23.8% of the Hirshfeld surface, are displayed on the fingerprint plot as a pair of long

**Figure 1**

The molecular structure of (I) with displacement ellipsoids drawn at the 50% probability level. The short intramolecular  $\text{S}\cdots \text{O}$  contacts are shown as dashed lines.

**Figure 3**

Hirshfeld surface for (I) scaled from  $-0.16$  (red) a.u. to  $1.09$  (blue) a.u.

**Table 2**

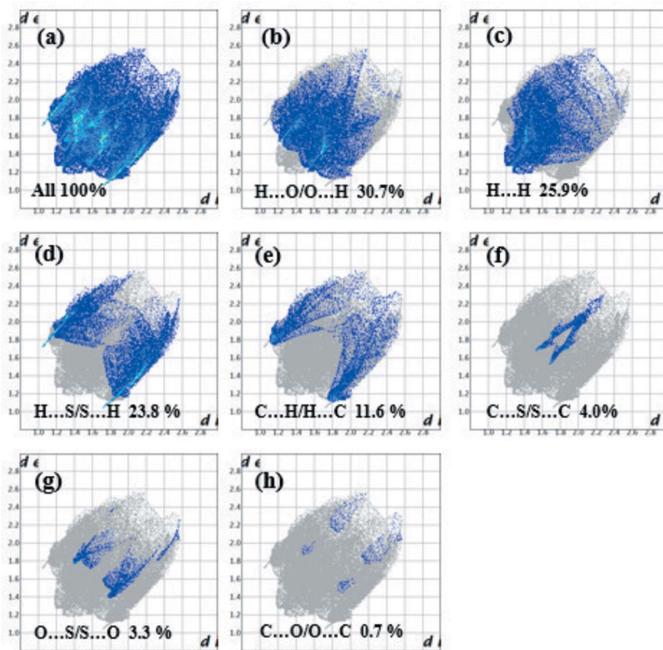

Relative percentage contributions of the close contacts to the Hirshfeld surface of the title compound.

Contact type	Percentage contribution
O...H/H...O	30.7
H...H	25.9
S...H/H...S	23.8
C...H/H...C	11.6
S...C/S...C	4.0
S...O/O...S	3.3
C...O/O...C	0.7

spikes at  $d_e + d_i = 2.7\text{\AA}$ . This distance differs by 0.3 \AA from the sum of the van der Waals radii, which means it is the strongest interaction present. The S...C/C...S (4.0%, Fig. 4f) and S...O/O...S (3.3%, Fig. 4g) contacts are seen as pairs of spikes at  $d_e + d_i = 3.2$  and  $3.05\text{\AA}$ , respectively. These distances are shorter than the sums of the van der Waals radii of 3.5 and  $3.32\text{\AA}$ , respectively. The C...O/O...C interactions make a contribution of 0.7% to the Hirshfeld surface (Fig. 4h), their interatomic distances ( $d_e + d_i = 3.3\text{\AA}$ ) being larger than the sum of the van der Waals radius ( $3.22\text{\AA}$ ), so this interaction is very weak in this structure. The fingerprint plot corresponding to C...H/H...C contacts (Fig. 4e) shows a fin-like distribution of points with the edges at  $d_e + d_i = 2.8\text{\AA}$ .

## 5. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.43, last update March 2022; Groom *et al.*, 2016) for the 1,3-dithietane fragment yielded three relevant hits. These

**Figure 4**

Two-dimensional finger print plots for (I): (a) overall, and delineated into contributions from different contacts: (b) H...O/O...H, (c) H...H, (d) H...S/S...H, (e) C...H/H...C, (f) C...S/S...C, (g) O...S/S...O and (h) C...O/O...C.

are dispiro[1,3-dithietane-2,2':4,2''-diadamantane] (CSD refcode AFECAP; Linden *et al.*, 2002), *trans*-2,4-bis(isopropyl)-2,4-bis[(2-methyl-1-thioxo)propylsulfanyl]-1,3-dithietane (HUZHOZ; Mahjoub *et al.*, 2003) and 2-(nitromethylene)-1,3-dithietane (WOCQEK; Shanmuga Sundara Raj *et al.*, 2000): in these compounds the dithietane ring is planar. In (I), the angles C1—S1—C8 and S1—C8—S2 are 82.7 (3) and 93.6 (3)\text{^\circ}, respectively, similar to the values observed for the aforementioned compounds, *viz.* 85.76 and 94.24\text{^\circ}, 85.40 and 94.60\text{^\circ}, 82.8 and 94.00\text{^\circ} for AFECAP, HUZHOZ and WOCQEK, respectively. A search for the cyclohexane-1,3-dione fragment revealed over 30 hits. The most relevant structures are 2-(phenylaminomethylidene)cyclohexane-1,3-dione (ISUQAO; Kettmann *et al.*, 2004), (E)-5,5-dimethyl-2-[3-(4-nitrophenyl)allylidene]cyclohexane-1,3-dione (VUGVUQ; Jae Kyun Lee *et al.*, 2015), 2-[chloro(4-methoxyphenyl)methyl]-2-(4-methoxyphenyl)-5,5-dimethylcyclohexane-1,3-dione (TACZIJ; Saloua Chelli *et al.*, 2016) and 2-{(1S\*,2S\*)-2-[(E)-(2,4-dihydroxybenzylidene)amino]cyclohexyl}isoindoline-1,3-dione (EVABIN; Liu *et al.*, 2011). The cyclohexane ring adopts a chair conformation in all five of these compounds, as in the title compound.

## 6. Synthesis and crystallization

Potassium carbonate (0.3 mol, 42 g) in DMF (50 ml) was well stirred at room temperature. To this mixture, cyclohexane-1,3-dione (0.1 mol) was added and the resultant solution stirred at room temperature for 20 min. Carbon disulfide (0.15 mol, 9.0 ml) was then added in one lot. The reaction mixture was stirred and kept for 10 min at room temperature. Diiodomethane (0.12 mol) was added dropwise over 20 min and the reaction mixture stirred for 7 h at room temperature. Ice-water (500 ml) was added to the reaction mass, the solid was filtered and washed with water, dried and recrystallized from ethanol solution to give (I) in the form of colourless plates. Yield 81%; m.p. 487 K; UV ( $\text{H}_2\text{O}$ )  $\lambda_{\text{max}}$ , 335 nm ( $\epsilon$  18760); IR (KBr,  $\text{cm}^{-1}$ ): 1640 (C=O),  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  (ppm): 4.35 (*s*, 2H,  $\text{CH}_2-\text{S}$ ), 2.52 (*t*,  $J = 6.5\text{ Hz}$ , 4H,  $\text{CH}_2-\text{CH}_2-\text{CH}_2$ ), 1.97 (*q*,  $J = 6.5\text{ Hz}$ , 2H,  $\text{CH}_2-\text{CH}_2-\text{CH}_2$ );  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  (ppm): 197.28 (CO), 189.73 (C=C-S), 119.93 (C=C-S), 37.31 ( $\text{CH}_2-\text{CH}_2-\text{CH}_2$ ), 33.39 ( $\text{CH}_2-\text{S}$ ), 18.62 ( $\text{CH}_2-\text{CH}_2-\text{CH}_2$ ).

## 7. Refinement

Crystal data, data collection and structure refinement details for the title compound are summarized in Table 3. H atoms were positioned geometrically with  $\text{C}-\text{H} = 0.97\text{\AA}$  and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
