Crystal structure of 2,6-bis(3-hydroxy-3-methylbut-1-yn-1-yl)pyridine monohydrate

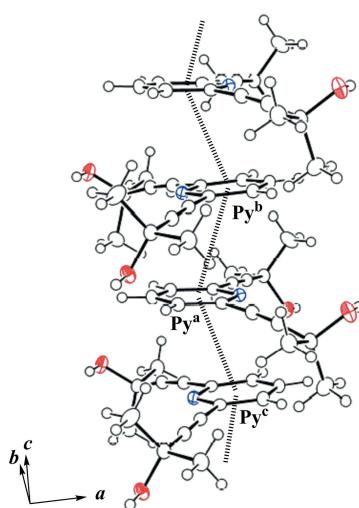

Take-aki Koizumi* and Toshikazu Takata

School of Materials and Chemical Technology, Tokyo Institute of Technology, 4259 Nagatsuta, Midori-ku, Yokohama, 226-8503, Japan. *Correspondence e-mail: koizumi.t.aa@m.titech.ac.jp

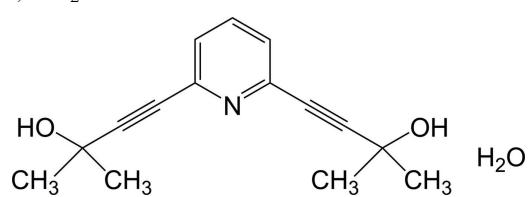

In the title pyridine derivative, $C_{15}H_{17}NO_2 \cdot H_2O$, the two OH groups are oriented in directions opposite to each other with respect to the plane of the pyridine ring. In the crystal, hydrogen bonds between the pyridine molecule and the water molecule, *viz.* $O_{\text{hydroxy}}-\text{H}\cdots\text{O}_{\text{water}}$, $O_{\text{hydroxy}}-\text{H}\cdots\text{O}_{\text{hydroxy}}$, $O_{\text{water}}-\text{H}\cdots\text{O}_{\text{hydroxy}}$ and $O_{\text{water}}-\text{H}\cdots\text{N}_{\text{pyridine}}$, result in the formation of a ribbon-like structure running along [011].

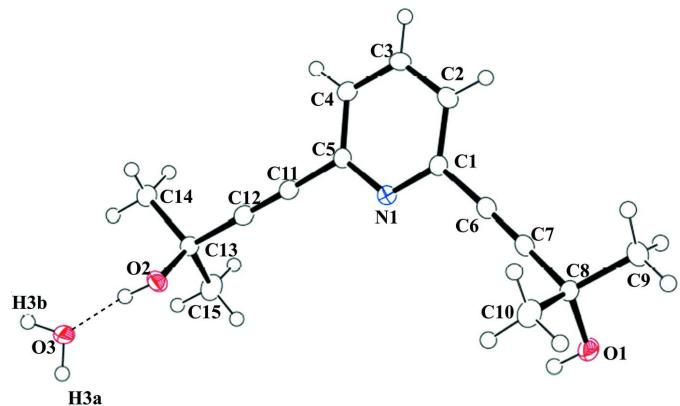

1. Chemical context

Pyridine derivatives with propargyl alcohol groups as substituents in the 2,6-positions are interesting compounds that have been used as synthons of many reactive compounds (Furusho *et al.*, 2004) and polymers (Miyagawa *et al.*, 2010, 2011), as starting materials of helical polymers (Inouye *et al.*, 2004; Waki *et al.*, 2006; Abe, Machiguchi *et al.*, 2008; Abe, Murayama *et al.*, 2008), and as ligands for transition-metal complexes (Hung *et al.*, 2009). Since such compounds have rigid structures containing one pyridine nitrogen and two alcoholic OH groups, they can be used to construct a higher order structure by coordination with metals and/or hydrogen-bond formation at multiple points. The crystal structures of 2,6-bis(3-methylbutyn-3-ol)pyridine, **1**, and its complex with triphenylphosphine oxide (**1**-OPPh₃) were reported by Holmes *et al.* (2002). In the crystal of **1**, the molecules form intermolecular hydrogen bonds with the pyridine ring and the two OH groups; the O–H…O hydrogen bonds from a 2_1 helical chain along the *b*-axis direction. The chains are linked by intermolecular N…H–O hydrogen bonds, forming a layer structure, and then form a stacking structure *via* C–H…O interactions between the layers. In contrast, in the case of **1**-OPPh₃, each of the two OH groups forms a hydrogen bond with the O atom of OPPh₃ without forming a network structure. Hence, it is expected that the crystal packing of **1** strongly depends on the presence or absence of hydrogen bonding. However, to our knowledge, the present examples have only been structurally analysed with 2,6-bis(propargyl alcohol)-substituted pyridines. In this paper, we report the crystal structure of 2,6-bis(3-methylbutyn-3-ol)pyridine monohydrate, **1**·H₂O.

OPEN ACCESS

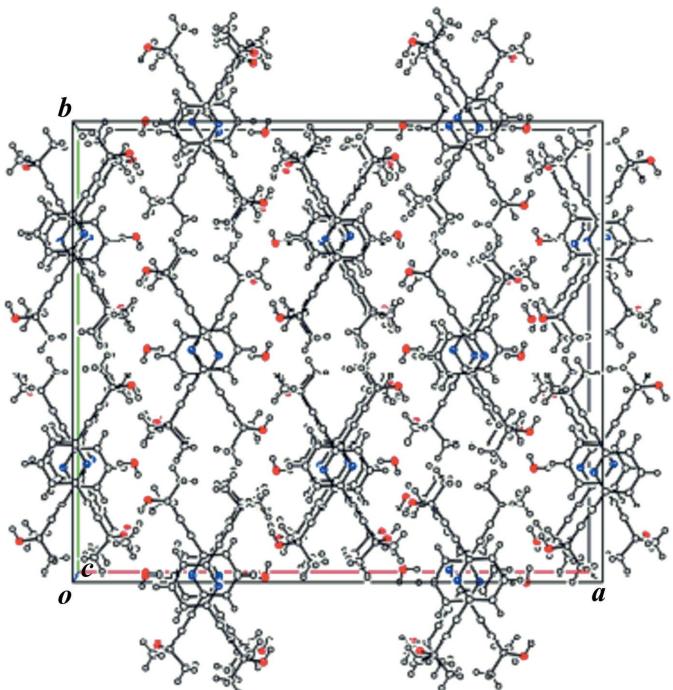

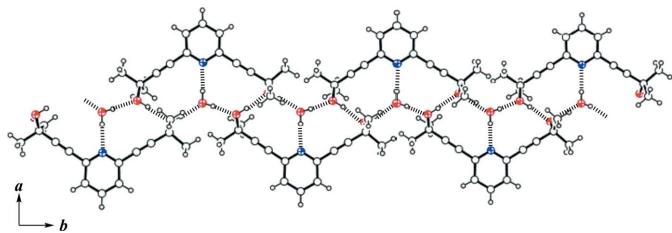

**Figure 1**

The molecular structure of the title compound with the atom labelling. Displacement ellipsoids are drawn at the 50% probability level. A dashed line indicates the O—H···O hydrogen bond.

2. Structural commentary

The molecular structure of the title compound is depicted in Fig. 1. The bond lengths of two $\text{C}\equiv\text{C}$ triple bonds ($\text{C}_6\equiv\text{C}_7$ and $\text{C}_{11}\equiv\text{C}_{12}$) are 1.199 (2) and 1.191 (2) Å, respectively, consistent with the triple-bond character. The $\text{C}_{ipso}-\text{C}\equiv\text{C}$ ($\text{C}_1-\text{C}_6\equiv\text{C}_7$ and $\text{C}_5-\text{C}_{11}\equiv\text{C}_{12}$) and $\text{C}\equiv\text{C}-\text{C}(\text{OH})$ ($\text{C}_6\equiv\text{C}_7-\text{C}_8$ and $\text{C}_{11}\equiv\text{C}_{12}-\text{C}_{13}$) bond angles are 176.0 (2), 176.4 (2), 174.6 (2) and 178.5 (2)°, respectively. $\text{C}_6\equiv\text{C}_7-\text{C}_8$ is slightly distorted from a linear structure compared to the other bonds. The two OH groups are oriented in directions opposite to each other with respect to the plane of the pyridine ring, and the pyridine ring makes dihedral

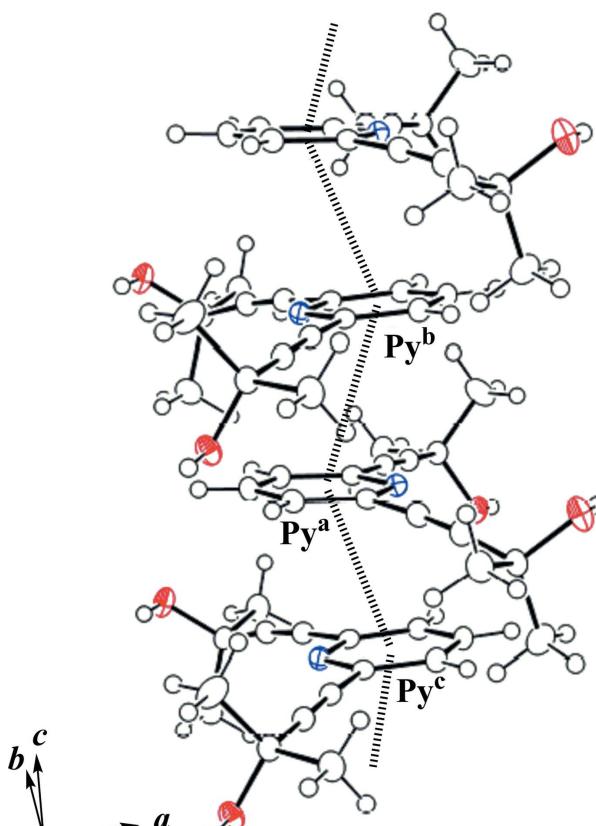

**Figure 2**
Packing diagram of the title compound, viewed down the *c* axis.**Figure 3**

Partial packing diagram of the title compound, showing the O—H···O and O—H···N hydrogen bonds (dashed lines) between **1** and water molecules.

angles of 50.50 (17) and 57.58 (15)°, respectively, with the $\text{C}_7/\text{C}_8/\text{O}_1$ and $\text{C}_{12}/\text{C}_{13}/\text{O}_2$ planes.

3. Supramolecular features

Fig. 2 depicts the packing of **1**– H_2O along the *c* axis. The water molecules present as the crystallization solvent form intermolecular O—H···O and O—H···N interactions with the hydroxyl groups and the N atoms of the pyridine unit of molecule **1** (Table 1), resulting in a ribbon-like structure along [011] (Fig. 3). The pyridine ring forms $\pi-\pi$ stacking interactions with that in a neighboring ribbon in an *anti*-parallel

**Figure 4**

O3—H3B···O1 ⁱⁱⁱ	0.83 (3)	2.01 (3)	2.8361 (19)	173 (3)

Symmetry codes: (i) $-x + \frac{3}{4}, y - \frac{1}{4}, z + \frac{1}{4}$; (ii) $-x + \frac{3}{4}, y + \frac{1}{4}, z - \frac{1}{4}$; (iii) $x, y + \frac{1}{2}, z - \frac{1}{2}$.

mode, resulting in a $\pi\cdots\pi$ network along the c axis (Fig. 4). The centroid–centroid distance between the pyridine rings [$Cg\cdots Cg^{\text{iv}}$; symmetry code: (iv) $-x + \frac{1}{2}, -y + 1, z + \frac{1}{2}$] is 3.5538 (11) \AA . In the crystal of non-solvated **1** (space group $P2_1/c$; Holmes *et al.*, 2002), such $\pi\cdots\pi$ stacking interactions between the pyridine rings are not found.

4. Database survey

The Cambridge Structural Database (CSD version 5.41, update of March 2020; Groom *et al.*, 2016) has 138 entries for structures containing 2,6-diethynylpyridine scaffolds, and for 2,6-bis(1-propyn-3-ol) derivatives gave two hits. The non-solvated compound 2,6-bis(3-methylbutyn-3-ol)pyridine (refcode LUMYEX) and its complex with $\text{O}=\text{PPh}_3$ (LUMYIB) have been reported (Holmes *et al.*, 2002). The benzene derivative containing two propargyl alcohol units at the 1,3-positions gives 34 hits; however, there is no report of a simple benzene derivative having a structure similar to that of **1**.

5. Synthesis and crystallization

2,6-Bis(3-methylbutyn-3-ol)pyridine was prepared by using a modified Potts method (Potts *et al.*, 1993). 2,6-Dibromopyridine (9.1 g, 38 mmol) was reacted with 2-methyl-3-butyn-2-ol (13 g, 151 mmol) using CuI (225 mg, 1.3 mmol)/ $\text{PdCl}_2(\text{PPh}_3)_2$ (840 mg, 1.3 mmol) as a catalyst in a THF (50 mL)– NEt_3 (150 mL) solvent for 19 h at room temperature. The resulting dark-brown solution was quenched with an aqueous NH_4Cl solution and the obtained solid was eliminated by celite filtration. The solution was extracted by AcOEt, and the organic phase was dried over MgSO_4 . After filtering off the desiccant, the filtrate was concentrated and subjected to silica-gel chromatography (eluent: AcOEt:hexane 3:2). Single crystals suitable for X-ray diffraction studies were obtained from an ethyl acetate solution *via* slow evaporation in air.

6. Refinement

Crystal data, data collection and refinement details are summarized in Table 2. Water H atoms and alcohol H atoms were located in a difference-Fourier map, and were refined freely. All of the C-bound H atoms were positioned geometrically ($\text{C}-\text{H} = 0.93$ or 0.98\AA), and were refined using a

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
