# A Corrigendum on

# Clinical Features of Headache in Patients With Diagnosis of Definite Vestibular Migraine: The VM-Phenotypes Projects

by Teggi, R., Colombo, B., Albera, R., Asprella Libonati, G., Balzanelli, C., Batuecas Caletrio, A., et al. (2018). Front. Neurol. 9:395. doi: 10.3389/fneur.2018.00395

In the original article, there was an error. The authors regret that, although it was mentioned in the **Discussion** section, it was not made sufficiently clear in the **Materials and Methods** section that the results presented on headache features are based, for the most part, on the same patients' population as described in a previous paper (see reference 16), in which however, only the vestibular aspects were reported.

A correction has been made to the Materials and Methods section, subsection Patients, paragraph one:

"In this cross-sectional observational multicentric study, 279 subjects were recruited in different centers in Italy and Spain between January 2016 and March 2017. Participating centers (in order

1

of number of enrolled patients) were Naples (51 patients), Milan (45), Brescia (45), Florence (23), Turin (20), Granada (19), Pisa (16), Parma (15), Salamanca (12), Matera (12), Siena (10), Madrid (6), and Chieti (5). All patients presented a diagnosis of definite VM according to the Bárány/ICHD Society criteria (10). To be included, all patients should have at least five attacks of headache with migrainous features. Of the 279 subjects, 235 (84.2%) were female. The age at inclusion was  $45.8 \pm 13.8$ 

years (range 18–78 years). All patients were interviewed by a senior neuro-otologist. A six months' follow-up was required to confirm the diagnoses before inclusion. The vestibular phenotype of 252 of the 279 subjects included in this study was previously published (14)."

The authors apologize for this error and state that this does not change the scientific conclusions of the article in any way. The original article has been updated.
