Received 30 July 2010; accepted 26 August 2010

Key indicators: single-crystal X-ray study;  $T = 90\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.079;  $wR$  factor = 0.156; data-to-parameter ratio = 19.4.

In the title dinuclear copper complex,  $[\text{Cu}_2\text{Cl}_4(\text{C}_{29}\text{H}_{34}\text{N}_6)] \cdot 1.5\text{H}_2\text{O}$ , both  $\text{Cu}^{\text{II}}$  ions are coordinated in a slightly distorted square-pyramidal environment in which the N atoms of the dipicolylamine group and a chloride ligand form the basal plane. The apical position is occupied by a second chloride atom. The  $\text{Cu}-\text{N}$  distances involving the pyridine N atoms differ slightly from each other and the  $\text{Cu}-\text{N}$  distance involving the tertiary N atom is the longest. The apical  $\text{Cu}-\text{Cl}$  distance is elongated compared to its basal counterpart due to typical Jahn–Teller distortion. In the crystal structure, complex and water molecules are linked via intermolecular  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{Cl}$  hydrogen bonds into chains along [001]. One of the water molecules was refined with half occupancy.

[ $\mu$ -N,N,N',N'-Tetrakis(2-pyridylmethyl)pentane-1,5-diamine]bis[dichloridocopper(II)] ses-quihydrate

M. Bartholomä, H. Cheung, K. Darling and J. Zubieta

### Comment

The described ligand has been used as starting material for hydrothermal synthesis of metal-organic transition metal/molybdateoxide frameworks in the principal author's laboratory (Bartholomä, unpublished results). The dipicolylamine moiety has originally been developed in our laboratory as metal chelating entity for binding of the  $M(CO)_3$  core ( $M = Re, {}^{99m}Tc$ ) for radiopharmaceutical purposes. However, a different coordination mode has been observed for the  $M(CO)_3$  core in which the dipicolylamine metal chelate is coordinated in a facial manner (Bartholomä, 2009).

The title complex was prepared as part of a series with different cadmium and copper salts to study the coordination properties of the ligand with these metals without the interaction of metaloxide clusters (Bartholomä, 2010a,b,d). The shorter homologue  $N^1,N^1,N^4,N^4$ -tetrakis(pyridin-2-ylmethyl)butane-1,4-diamine gave structurally similar complexes with copper bromide as metal salt. The corresponding Cu—N<sub>py</sub> distances are 2.015 (6) Å and 2.019 (6) Å and the Cu—N<sub>tert</sub> distance was determined to 2.053 (5) Å (Bartholomä, 2010c).

Crystal structures of the ligands  $N^1,N^1,N^3,N^3$ -tetrakis(2-pyridiniomethyl)-1,3-diaminopropane and  $N^1,N^1,N^4,N^4$ -tetrakis(pyridin-2-ylmethyl)butane-1,4-diamine have been described recently (Fujihara, 2004; Mambanda, 2007). Superoxide dismutase activity of iron(II) complexes of  $N^1,N^1,N^3,N^3$ -tetrakis(2-pyridiniomethyl)-1,3-diaminopropane and related ligands has been investigated by Tamura *et al.* (2000). Studies on the thermodynamic and kinetic behaviour of the reaction of platinum(II) complexes of higher ligand homologues with chloride have been performed by Ertürk *et al.* (2007).

### Experimental

**$N^1,N^1,N^5,N^5$ -tetrakis(pyridin-2-ylmethyl)pentane-1,5-diamine.** An amount of 1.00 g (9.78 mmol) 1,5-diaminopentane was dissolved in 30 ml anhydrous dichloroethane under an inert atmosphere (argon) followed by the addition of 3.91 ml (41.10 mmol) pyridine-2-carboxaldehyde. The mixture was stirred for 15 min at r.t. and then cooled with an ice bath prior to the portionwise addition of 12.44 g (58.72 mmol) sodium triacetoxyborohydride (gas evolution, exothermic reaction). The reaction was stirred overnight allowing the temperature slowly to rise to room temperature. The reaction was quenched by the dropwise addition of saturated sodium bicarbonate solution and stirring was continued until the gas evolution ceased. The mixture was separated and the organic layer was further washed with saturated sodium bicarbonate solution, water and brine. The organic phase was dried with anhydrous sodium sulfate, filtered and the solvent removed under reduced pressure. The crude reaction mixture was then purified by silica gel column chromatography starting with chloroform and increasing gradient to chloroform:methanol 10:1 (v/v). Yield: 4.02 g (86%).  ${}^1H$  NMR ( $CDCl_3$ ):  $\delta = 8.39$  (m, 4H), 7.49 (m, 4H), 7.37 (d,  $J = 7.81$  Hz, 4H), 6.95 (m, 4H), 3.64 (s, 8H), 2.36 (m, 4H), 1.33 (m, 4H), 1.07 (m, 2H) p.p.m..

---

**Synthesis of metal complex.** To 2 ml of an aqueous solution of copper chloride, two equivalents (50 mg, 0.11 mmol) of *N<sup>1</sup>,N<sup>1</sup>,N<sup>5</sup>,N<sup>5</sup>-tetrakis(pyridin-2-ylmethyl)pentane-1,5-diamine in 2 ml methanol were added followed by the addition of 2 ml *N,N*-dimethylformamide. Single crystals were obtained after a week by slow evaporation of the solvents at room temperature.*

## Refinement

All the H atoms were placed in idealized positions and refined by the riding model approximation with C—H<sub>aryl</sub> = 0.95 Å, C—H<sub>methyl</sub> = 0.98 Å and C—H<sub>methylene</sub> = 0.99 Å and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$  and  $1.2U_{\text{eq}}(\text{C}_{\text{methylene/aryl}})$ . Water hydrogen atoms were initially located in the difference Fourier map but were then refined with O—H = 0.84 (2) Å and  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$ .

## Figures

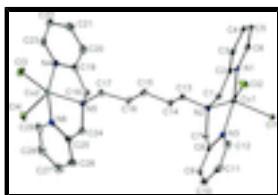

Fig. 1. The molecular structure of the title complex. The displacement ellipsoids are drawn at 50% probability level. solvent water molecules and hydrogen atoms are omitted for clarity.

	$k = -18 \rightarrow 18$

$T_{\min} = 0.709$ ,  $T_{\max} = 0.824$

31227 measured reflections

$l = -36 \rightarrow 35$

### Refinement

Refinement on  $F^2$

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.079$

Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.156$

H atoms treated by a mixture of independent and constrained refinement

$S = 1.40$

$$w = 1/[\sigma^2(F_o^2) + (0.0289P)^2 + 16.2006P]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

7827 reflections

$$(\Delta/\sigma)_{\max} = 0.003$$

404 parameters

$$\Delta\rho_{\max} = 0.81 \text{ e \AA}^{-3}$$

5 restraints

$$\Delta\rho_{\min} = -0.67 \text{ e \AA}^{-3}$$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
