**Background:** Prior to 2015, clinical consultation was the only clinical service provided by clinical pharmacists in Changsha Second Hospital. Between 2015 and 2017, a train-the-trainer program was implemented to train clinical pharmacists to provide pharmaceutical care and to conduct clinical research. The objective of the study is to examine the impact on the clinical services provided by pharmacists after the implementation of the train-the-trainer program.

**Patients and methods:** Between 2004 and 2014, all completed clinical consultation activities were tallied and summarized. The results from the tallied consultation activities were used as a baseline for clinical activities provided by pharmacists prior to the training. A structured training program was implemented between 2015 and 2017 to train clinical pharmacists to provide pharmaceutical care. After the implementation of the training program was completed, all clinical activities provided by pharmacists between January 2017 and December 2017 were documented in the clinical workload form. The clinical activities completed by each pharmacist were tallied and summarized.

**Results:** Between 2004 and 2014, a total of 6569 (average 657 per year) pharmacy consultations were requested and completed from a total of 44 departments. In 2017, a total of 15,078 hrs of clinical activities were logged. The pharmacists completed 3481 consultations in 2017 (an increase of 430%), averaging 316 consultations for each pharmacist and 271.8 hr per pharmacist. Over 2000 hrs (of the 15,078 hrs) were spent on direct patient care by the pharmacists.

**Conclusion:** This study shows that there was a 430% increase in clinical pharmacy consultation services provided by the clinical pharmacists after the implementation of the training program. This is directly related to the number of well-trained pharmacists available. After the implementation of the train-the-trainer program, the range of services as well as the number of clinical services and clinical hours spent on providing pharmaceutical care have significantly increased.

**Keywords:** clinical pharmacy, pharmacy consultation, pharmacy services, pharmaceutical care

#### Introduction

Clinical pharmacy services are integral parts of patient care. It has been shown that clinical pharmacy services have reduced morbidity and mortality rates, reduced hospitalization and provided economic benefits to health-care system.<sup>1–3</sup> In 2009, the National Health and Family Planning Commission of the People's Republic of China introduced an aggressive policy to provide affordable and equitable basic health care for everyone in China by 2020. The areas of focus for the reform include expansion of insurance coverage for more than 90% of the people, creation of a national essential medicine

To assist this, the Ministry of Health in China mandated clinical pharmacy services be integrated into hospitals.<sup>7</sup> The new role is aimed to provide direct patient care by pharmacists and to foster effective and efficient use of medications.

To prepare the pharmacists to assume this new role, universities such as Peking University have offered 6-year dual Bachelor and Master Degrees in clinical pharmacy since 2011.<sup>8</sup> In addition, many pharmacists in China are training overseas and as well, foreign academics are visiting China to assist the pharmacists in implementing clinical services in China.<sup>9,10</sup>

The Second Xiangya Hospital of Central South University, Changsha, Hunan, consists of almost 4000 inpatient beds with over 110,000 admissions annually. There are 44 medical service departments in the hospital. In early 2000, the department of pharmacy initiated the clinical pharmacy program, by providing consultation services to all physicians in the hospital. The service was fully implemented in 2004 when the department appointed a Clinical Pharmacy Leader. The physicians would submit a consultation request by completing a request form and notifying the clinical pharmacy department by telephone after patient care rounds. Each clinical pharmacist is assigned to cover consultations from specific areas such as oncology, pediatric intensive care unit, cardiovascular intensive care unit, cardiology, endocrinology, transplant, pulmonary and infectious diseases. The consultations must be completed on the same day of request.

In 2015, the Second Xiangya Hospital of Central South University collaborated with the University of Alberta, Faculty of Medicine and Dentistry/Department of Family Medicine to implement a train-the-trainer program in the department of pharmacy.<sup>9,11,12</sup> A clinical pharmacist with a Doctor of Pharmacy degree, from the Department of Family Medicine, developed and implemented the program. The main objectives of the train-the-trainer program were to teach clinical pharmacists to 1) provide direct patient care, 2) conduct clinical research and 3) mentor other clinical pharmacists throughout China.

## Aim of the Study

The objectives of the study are 1) to examine clinical services provided by the department of pharmacy prior to

2015 and 2) to evaluate the expansion of clinical pharmacy services post 2015.

## **Ethics Approval**

The study was approved by the Second Xiangya Hospital of Central South University Ethics Committee.

## Method

#### Design

The train-the-trainer program consisted of a mix of one-on -one and group teaching methods. As a group, the pharmacists were given weekly therapeutic lectures. Each morning, the clinical pharmacists attended daily patient care rounds and addressed any patient issues with the physicians. In the afternoon, the trainer and the pharmacist had a one-on-one discussion about the patients for whom he/she provided care.

In 2015, prior to the implementation of the train-thetrainer program, the clinical pharmacy leader and the trainer assessed all clinical services provided by the department of pharmacy. Following the implementation of the train-the-trainer program, a workload documentation form was developed to assist clinical pharmacists to document their daily clinical activities. The clinical activities consisted of six categories: consultation, clinical (patient care rounds), training and education, research, academic, and others. All clinical pharmacists were required to log the time spent on 15 mins increment on each category daily and submit the documentation to the clinical pharmacy leader each month.

#### Analysis

Descriptive statistics were used to describe the total activities and the frequency of each of the categories.

#### Results

Prior to 2015, consultation was the predominant clinical service that was provided by the clinical pharmacists. Between 2004 and 2014, there was a total of 6569 pharmacy consultations requested and completed from a total of 44 departments (Table 1). Majority (n=1596, 28.4%) of the consultations came from the neurosurgical ward, which was the first department to be serviced by a pharmacist. The most frequent consultation requests (57.8%) were from surgical departments (Neurosurgical, Orthopedic, Thoracic surgery, Spinal Surgery, Urological Surgery). The consultation requests generally increased over 11

years (Table 2). The most common reason for consultation requests was regarding antimicrobial therapy (Table 3). Of note, there is a positive correlation with the number of clinical pharmacists available and consultation requests (r = 0.95), p < 0.01. After the completion of the training, the clinical pharmacists began the documentation of clinical activities starting January 2017. In 2017, there were 13 clinical pharmacists, which is an increase of three clinical pharmacists since 2014. The total number of pharmacist hours logged was 15,078 with most time spent on research which was closely followed by consultation. The pharmacists completed 3481 consultations in that year averaging 316 consultations each and 271.8 hrs per pharmacist. Over 2000 hrs were spent on patient care rounds by 12 out of 13 pharmacists (Table 4).

#### Discussion

Since the early 1990s, the economic benefits of clinical hospital pharmacists in North America are well documented.<sup>13–15</sup> In addition, it has been shown that clinical pharmacists reduced medication errors, improved medication utilization, enhanced medication adherence and engaged in antibiotic stewardship.<sup>16–19</sup> New policies in China have recently led to the implementation of clinical pharmacy services in hospitals across the country. There is a mandate by the government to have at least five clinical pharmacists in each tertiary hospital.

Table 2 Total Number of Pharmacists and Consults Completed

Year	Total Number of Pharmacists	Number of Consults
2004	3	90
2005	3	86
2006	3	106
2007	3	84
2008	3	167
2009	3	440
2010	3	453
2011	6	972
2012	6	1267
2013	9	1735
2014	10	1565

Pearson's correlation coefficient r = 0.95, Coefficient of determination  $R^2 = 0.90$ .

Table 3 Consultation Services Provided Between 2004 and 2014

Type of Service	Frequency
Pharmacokinetics	51
Dosage adjustment	86
Other medication recommendation	204
Antimicrobial use	2093
Others	3588

The new government policies provide clinical pharmacists an opportunity to demonstrate to both the hospital administration and physicians that their training and skills offer enhanced patient care.

The results from this study clearly show that the clinical pharmacist service was greatly in demand and utilized at the Second Xiangya Hospital of Central South University. Between 2004 and 2010, the pharmacy department only had three clinical pharmacists. During the period of 2006 and 2007, two of the pharmacists were pursuing their PhD degree while working in the hospital. As a result, the number of consultations declined (Table 1). The number of consultations, however, more than doubled when the two pharmacists completed their degree (2008 = 167, 2009 =440). In 2011, the number of pharmacists doubled and so did the consultations (2010 = 453, 2011 = 972). It appears that pharmacist availability has a direct effect on consultation rate, which has a major effect on clinical management. Because the computerized patient electronic database was not fully completed until January 2014, we selected 2014 to analyze the type of services requested by consultation. Antimicrobial use consultation was the service most requested in 2014.

After the implementation of the train-the-trainer program, the clinical pharmacists were able to expand clinical pharmacy services beyond consultations. A new activity introduced was to participate in patient care rounds. The clinical pharmacists were able to integrate into medical teams and participate in providing direct patient care with the physicians. The clinical pharmacists proactively identified therapy-related problems, adjusted dose based on patient age or comorbidity such as renal insufficiency, monitored both

Table 4 Clinical Services Provided by Clinical Pharmacists in 2017

efficacy and toxicity and followed up on daily patient care rounds. One of the pharmacists (#10) spent significant amount of time in research and did not complete any consultation or patient care rounds. The main reason is this pharmacist was prepared to submit a grant application to go abroad to extend his research. He did extra research hours and another pharmacist (#9) took over his consultations. This also demonstrates the flexibility according to skill sets within the department. In addition, one pharmacist (#7) only submitted 724 hrs of clinical activities because she was on maternity leave for 6 months in 2017. The last two pharmacists (#12, #13) are new clinical pharmacists who joined the clinical pharmacy department mid-2017. As a result, their total clinical activities are much lower than the rest of the pharmacists. Clinical pharmacist #1 contributed significant amount of time in academia. The main reason is because that pharmacist has a faculty cross-appointment with the Central South University to teach pharmacy students clinical pharmacy.

In addition to consultations and patient care rounds, the clinical pharmacists were able to identify issues related to patient care in the hospital and conduct clinical research to improve the delivery of care. For example, the hospital uses acetaminophen and diclofenac combination product administered intramuscularly instead of opioid for post-operatively pain. A pharmacist noticed that there was an increased number of surgical patients with an elevated serum creatinine after surgery. The pharmacists conducted a chart review which showed that there was an association between diclofenac use and acute renal injury.<sup>20</sup>

To our knowledge, this is the first extensive descriptive reporting of clinical pharmacy services in a tertiary teaching hospital in China. The study highlights the clinical pharmacy activities provided in a tertiary teaching hospital after successfully implementing a train-the-trainer program. Because this was such a novel activity, there were some growing pains evident. For example, although clinical pharmacists logged their clinical activities daily, some data were still missing on the daily basis which needs to be corrected.

## Conclusion

There has been an increase in clinical pharmacy services after the implementation of the train-the-trainer program. This is directly correlated to the number of well-trained pharmacists. After the implementation of the train-the-trainer program, the range of services as well as the number of clinical services and clinical hours spent on providing pharmaceutical care were significantly increased.

## **Ethics Approval**

The study received ethics approval from the Second Xiangya Hospital of Central South University Ethics Committee.

### Acknowledgments

We would like to thank all the clinical pharmacists for their participation and Yi Wen Xiao, Yi Ping Liu, Qiong Lu, and Qiang Yong Yan for assisting with the clinical pharmacists.
