## Supplementary Table 1 | FOS GLMM statistics for individual brain regions.

Summary information for each brain region in the Allen CCF that met the following criteria: (1) total volume  $\geq 0.1 \text{ mm}^3$ ; (2) lowest level of its branch of the ontology tree (cortical layers not included); and (3) **Flavour\*Time point** predictors (all main effects and interactions) significantly improved overall FOS GLMM performance (equation (2); see Methods). *P* values are from likelihood-ratio  $\chi^2$ -tests comparing full and reduced models. Uncorrected *P* values are reported here. The critical *P* value for significance while permitting a 10% FDR using the Benjamini-Krieger-Yekutieli procedure was 0.1172. Of 200 regions that met criteria (1) and (2), 130 also met criterion (3) and are listed below. Novel – familiar  $\Delta$ FOS values for the consumption, malaise, and retrieval time points were calculated using the GLMM from equation (2), and values for the CGRP stimulation time point were calculated using the GLMM from equation (4).

| Name                                          | Abbrev. | Parent          | GLMM <i>P</i> value | Novel – familiar $\Delta$ FOS (Z) |         |           |           |
|-----------------------------------------------|---------|-----------------|---------------------|-----------------------------------|---------|-----------|-----------|
|                                               |         |                 |                     | Consume                           | Malaise | Retrieval | CGRP stim |

## Supplementary Table 2 | Summary of statistical tests.

All statistical tests were two-sided. Paired tests were performed whenever possible. Corrections for multiple comparisons were performed using the Hochberg-Bonferroni procedure. Corrected *P* values are reported here. NS, not significant, \**P* ≤ 0.05, \*\**P* ≤ 0.01, \*\*\**P* ≤ 0.001, \*\*\*\**P* ≤ 0.0001.
