Agriculture

Biomass burning

ABSTRACT

This data article provides an extensive and complete description of the high spatial resolution inventory (HSRI) estimation shown in the article “High resolution inventory of atmospheric emissions from livestock production, agriculture, and biomass burning sectors of Argentina” Puliafito et al. [1], and its comparison with several sectors in Argentina. The dataset provided are high-resolution inventories ($0.025^\circ \times 0.025^\circ$ lat/long) for CO₂, CH₄, N₂O and another 8 species from livestock, biomass burning, agriculture and another 12 sectors (based on 2016 year). In addition, we also provide the database for 2014 using the same methodology. The dataset presented are necessary to improve input inventories for air quality models. Also, they are better to inform and guide the stakeholders, in making decisions related to environmental protection and health promotion, as well as assessing the environmental performance in terms of atmospheric emissions of an activity, sector or region in Argentina.

amounts for the years considered for each sector and pollutants of Argentina [1] are shown in Table 2. Dataset is available in detail for a high resolution ($0.025^\circ \times 0.025^\circ$ lat/long) in all sectors and their species respectively (see the repository).

2. Experimental design, materials, and methods

Data on HSRI for various Argentinians sectors management procedures was collected through primary and secondary sources of local accessible reports, literature and guidelines. The global methodology applied is based on the European regulations grouped on European Monitoring and Evaluation Program (EMEP) [4,5]. In addition, the used emission factors are those indicated by EMEP according to the adopted level of detail, which concerns level 2 in almost all cases. In some cases, the data on the activity and the use of specific national emission factors were used following the Third National Communication (TCNA) [6] of Argentina to the United Nations Convention on Climate Change. For specific subsectors, we used the recommendations (which are indicated in each case) of the Intergovernmental Panel on Climate Change (IPCC) [7]. With respect to the inventory of Livestock, Agriculture, and Biomass burning sectors they have been provided by Ref. [1]. Road transport sector was updated using the same resolution of this article following the steps from Ref. [3] and the other sectors by Refs. [2,8].

Acknowledgments

The authors would like to thank Universidad Tecnológica Nacional (UTN) (National Technological University) and Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET) (National Council for Scientific and Technical Investigations) for supporting research activities. This work is granted by UTN IFI Projects PID 1799 and 1487, CONICET (PIP 112 201101 00673) and Agencia FONCYT (PICT 2016 1115). All data requests should be addressed to the first author.

Conflict of Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.
