Received 16 June 2010; accepted 20 June 2010

Key indicators: single-crystal X-ray study; $T = 294\text{ K}$; mean $\sigma(\text{C-C}) = 0.004\text{ \AA}$;
 R factor = 0.033; wR factor = 0.057; data-to-parameter ratio = 13.3.

In the title compound, $[\text{Co}(\text{C}_4\text{H}_4\text{O}_4)(\text{C}_9\text{H}_7\text{N})_2(\text{H}_2\text{O})_2]_n$, the Co^{II} cation, located on an inversion center, is coordinated by two succinate anions, two isoquinoline ligands and two water molecules in a distorted octahedral geometry. The succinate anion, located across another inversion center, bridges the Co cations, forming polymeric chains running along the b axis. The partially overlapped arrangement of parallel isoquinoline ring systems of adjacent polymeric chains and the shorter face-to-face distance of $3.402(6)\text{ \AA}$ indicates the existence of weak $\pi-\pi$ stacking in the crystal structure. Classical intra- and intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonding and weak non-classical intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonding help to stabilize the crystal structure.

Comment

The $\pi\cdots\pi$ stacking between aromatic rings is an important non-covalent interaction and correlated with the electron transfer process in some biological systems (Deisenhofer & Michel, 1989). As part of our ongoing investigation on the nature of $\pi\cdots\pi$ stacking (Su & Xu, 2004; Xu *et al.*, 2007), the title complex incorporating isoquinoline ligand has recently been prepared in the laboratory and its crystal structure is reported here.

A part of the polymeric molecular structure is shown in Fig. 1. The Co^{II} cation located on an inversion center is coordinated by two succinate anions, two isoquinoline ligands and two water molecules with a distorted octahedral geometry. The succinate anion is located across another inversion center, and bridges Co cations to form the one-dimensional polymeric chains running along the crystallographic *b* axis, similar to that found in a Ni^{II} complex bridged by succinate anions (Liu *et al.*, 2003). The carboxyl group is oriented with respect to the carbon skeleton of succinate anion at a dihedral angle of 28.4 (2)°.

The partially overlapped arrangement of parallel isoquinoline ring systems of adjacent polymeric chains related by a symmetry operation of (1-*x*, 1-*y*, -*z*) and shorter face-to-face distance of 3.402 (6) Å indicate the existence of weak $\pi\cdots\pi$ stacking in the crystal structure. Classical intra- and intermolecular O–H···O hydrogen bonding and weak non-classical intermolecular C–H···O hydrogen bonding help to stabilize the crystal structure (Table 1).

Experimental

The CoCl₂·6H₂O (0.48 g, 2 mmol), succinic acid (0.24 g, 2 mmol), NaOH (0.16 g, 4 mmol) and isoquinoline (0.23 ml, 2 mmol) were dissolved in a water/ethanol solution (20 ml, 1:1). The solution was refluxed for 4 h. The reaction mixture was cooled to room temperature and filtered. The single crystals were obtained from the filtrate after two weeks.

Refinement

Water H atoms were located in a difference Fourier map and refined as-riding in as-found relative positions with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$. Other H atoms were placed in calculated positions with C–H = 0.93 Å (aromatic) and 0.97 Å (methylene), and refined in riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.057$	H-atom parameters constrained
$S = 0.82$	$w = 1/[\sigma^2(F_o^2) + (0.0207P)^2]$
1891 reflections	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

142 parameters	$\Delta\rho_{\max} = 0.23 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.23 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
