Received 24 November 2007; accepted 26 November 2007

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$;
 R factor = 0.040; wR factor = 0.119; data-to-parameter ratio = 16.5.

In the title salt, $[\text{Co}(\text{C}_5\text{H}_4\text{N}_2\text{O}_2)_2(\text{H}_2\text{O})_2]\text{Cl}_2$, the Co^{II} ion is located on an inversion center. It is chelated by two neutral pyrimidine-2-carboxylic acid molecules and is coordinated by two water molecules in an octahedral coordination geometry. The cations and anions are linked via $\text{O}-\text{H}\cdots\text{Cl}$ hydrogen bonds into a layer structure; an intramolecular $\text{O}-\text{H}\cdots\text{N}$ hydrogen bond connects the carboxylic acid group to the pyrimidine N atom.

Diaquabis(pyrimidine-2-carboxylic acid- κ^2N,O)cobalt(II) dichloride

D.-J. Xu, B.-Y. Zhang, Q. Yang and J.-J. Nie

Comment

As part of our ongoing investigation on the nature of aromatic stacking (Cheng *et al.*, 2000; Wu *et al.*, 2003), the title Co^{II} compound has recently been prepared and its crystal structure is presented here.

The molecular structure of the title compound is shown in Fig. 1. The crystal of the title compound consists of complex cations and Cl⁻ anions. The Co^{II} located on an inversion center is coordinated by two neutral pyrimidine-2-carboxylic acid and two water molecules with an octahedral geometry (Table 1). The Cl⁻ anions link with the complex cations *via* O—H···Cl hydrogen bonding (Table 2 and Fig. 1). The charge balance indicates that the pyrimidine-2-carboxylic acid is a neutral ligand but not an anion; and the significant difference in C—O bond distances (Table 1) also suggests that the carboxyl group is not deprotonated. This is obviously owing to the acidified solution environment in the preparation of the compound (see _publ_section_exptl_prep). The intra-molecular O—H···N hydrogen bonding exists between the carboxyl group and adjacent pyrimidine-N atom (Fig. 1). Thus the pyrimidine-2-carboxylic acid can not play a role of bridge ligand in this structure, contrast to that found in pyrimidine-2-carboxylate complex of Co(II) reported previously (Rodriquez-Dieguez *et al.*, 2007).

π - π stacking is not observed in this crystal structure, which is different from the situation in a related Cu^{II} complex with pyrimidine-2-carboxylate (Zhang *et al.*, 2008). It may be due to extensive hydrogen bonding network involving coordinated water molecules and counter Cl⁻ anions.

Experimental

2-Cyanopyrimidine (0.19 g, 1.8 mmol), CoCl₂.6(H₂O) (0.24 g, 1 mmol) were dissolved in a mixture solution of water (15 ml) and ethanol (5 ml), then hydrochloric acid solution (3 ml, 37%) was added into the solution. The solution was refluxed for 5 h. Single crystals of the title compound were obtained after about one month.

Refinement

Hydroxy and water H atoms were located in a difference Fourier map and refined as riding in as-found relative positions, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Other H atoms were placed in calculated positions with C—H = 0.93 Å and refined in riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.040$	H-atom parameters constrained
$wR(F^2) = 0.119$	$w = 1/[\sigma^2(F_o^2) + (0.0359P)^2 + 1.9784P]$ where $P = (F_o^2 + 2F_c^2)/3$

$S = 1.12$	$(\Delta/\sigma)_{\max} < 0.001$
1763 reflections	$\Delta\rho_{\max} = 0.70 \text{ e \AA}^{-3}$
107 parameters	$\Delta\rho_{\min} = -0.72 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
