

2-Chloro-3-(4-chlorobenzamido)-1,4-naphthoquinone

Yakini Brandy, Ray J. Butcher,* Tolulope A. Adesiyun, Solomon Berhe and Oladapo Bakare

Department of Chemistry, Howard University, 525 College Street NW, Washington, DC 20059, USA

Correspondence e-mail: rbutcher99@yahoo.com

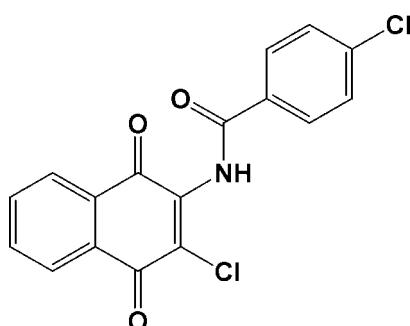

Received 3 December 2008; accepted 4 December 2008

Key indicators: single-crystal X-ray study; $T = 200$ K; mean $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$; R factor = 0.038; wR factor = 0.086; data-to-parameter ratio = 23.3.

The naphthoquinone ring is almost perpendicular [dihedral angle 71.02 (3) $^\circ$] to the phenyl group of the title compound, $\text{C}_{17}\text{H}_9\text{Cl}_2\text{NO}_3$, while the dihedral angle between the amide group and the 4-chlorophenyl ring is 21.9 (2) $^\circ$. The conformation of the N—H and C=O bonds are *anti* to each other. N—H \cdots Cl hydrogen bonds link the molecules into chains in the a -axis direction. In addition, these chains are linked by weak intermolecular C—H \cdots O interactions.

2-Chloro-3-(4-chlorobenzamido)-1,4-naphthoquinone

Y. Brandy, R. J. Butcher, T. A. Adesiyun, S. Berhe and O. Bakare

Comment

The amido and imido derivatives of 3-chloro-1,4-naphthoquinone are well known for their anti-inflammatory, antiplatelet, antiallergic and anticancer activities (Lien *et al.*, 1997; Huang *et al.*, 2005; Bakare *et al.*, 2003; Copeland *et al.*, 2007). The title compound, 2-chloro-3-(*p*-chlorobenzamido)-1,4-naphthoquinone was obtained as an intermediate in the synthesis of some oxazolo-1,4-naphthoquinone and imido-substituted-1,4-naphthoquinone analogs.

The naphthoquinone ring is almost perpendicular to the phenyl group of the title compound $C_{17}H_9Cl_2NO_3$, while the dihedral angle between the amide group and the 4-chlorophenyl ring is $21.9(2)^\circ$ (Fig. 1). The conformation of the N—H and C=O bonds are anti to each other (Gowda, Kožíšek *et al.*, 2008; Gowda, Tokarčík *et al.*, 2008). N—H \cdots Cl hydrogen bonds link the molecules into chains in the a direction. In addition, these chains are linked by weak intermolecular Ar—H \cdots O interactions (Fig. 2, Table 1).

Experimental

A mixture of 2-amino-3-chloro-1,4-naphthoquinone (213 mg, 1.03 mmol) and 4-chloro-benzoylchloride (2 ml) was refluxed for 2 1/2 h (powerstat setting at 70). The reaction mixture was cooled to room temperature. The precipitate was isolated by vacuum filtration and the yellow-grey solid was washed with diethyl ether. The crude was recrystallized from ethanol (20 ml) to obtain a yellow solid (67 mg, 18.8%). Crystals for *x*-ray study were obtained by recrystallization from methanol.

Refinement

All H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H = 0.95 Å, N—H = 0.88 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$.

Figures

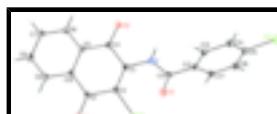

Fig. 1. View of (I) showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 20% probability level.

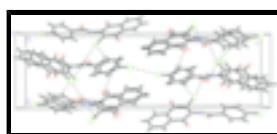

Fig. 2. View of the packing viewed down the a axis. Dashed bonds show weak C—H \cdots O interactions.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.038$	H-atom parameters constrained
$wR(F^2) = 0.086$	$w = 1/[\sigma^2(F_o^2) + (0.0416P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.93$	$(\Delta/\sigma)_{\text{max}} = 0.001$
4842 reflections	$\Delta\rho_{\text{max}} = 0.29 \text{ e \AA}^{-3}$
208 parameters	$\Delta\rho_{\text{min}} = -0.36 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Experimental. (CrysAlis RED; Oxford Diffraction, 2007) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
