Crystal structure of 5-benzyl-8-bromo-2-methyl-1,3-oxazolo[4,5-c][1,8]naphthyridin-4(5H)-one

Johannes Vrijdag, An Van den Bogaert, Wim De Borggraeve and Luc Van Meervelt*

KU Leuven - University of Leuven, Department of Chemistry, Celestijnenlaan 200F - bus 2404, B-3001 Heverlee, Belgium. *Correspondence e-mail: luc.vanmeervelt@kuleuven.be

The title compound, $C_{17}H_{12}BrN_3O_2$, was unexpectedly isolated during an attempt to synthesize pyridodiazepinediones and identified as an oxazolonaphthyridinone derivative. The almost planar oxazolonaphthyridinone ring ($r.m.s.$ deviation = 0.016 Å) makes a dihedral angle of 61.6 (2)° with the phenyl ring. In the crystal, columns of molecules stacked along the a axis are formed by π - π interactions between the six-membered rings of the oxazolonaphthyridone moieties [centroid-to-centroid distances = 3.494 (2)–3.906 (3) Å], which further interact through C–H \cdots π contacts with the phenyl rings.

1. Chemical context

While benzodiazepine drugs have been amongst the most prescribed medication globally since their discovery in the 1950s, the search for structurally related biologically active compounds is of major relevance to the pharmaceutical industry (Washton & Zweben, 2011). Previous work in our group dealing with the construction of pyridodiazepinediones (PZDs; Van den Bogaert *et al.*, 2010) led unexpectedly to the isolation of a tricyclic compound, which was later identified as oxazolonaphthyridinone (ONO) **6** (Fig. 1). Commercially available 2-hydroxynicotinic acid **1** was converted to dihalo-nicotinic acid **3** *via* two sequential halogenation reactions (Van den Bogaert *et al.*, 2010; Gero *et al.*, 1989; Haché *et al.*, 2002), after which a benzylamine substituent was introduced yielding the aza-anthrаниlic acid derivative **4**. Next, ester compound **5** was prepared from intermediate **4** and *tert*-butyl glycinate using a standard coupling procedure. Finally, *tert*-butyl ester **5** was deprotected *in situ* and reacted with acetic anhydride in the presence of potassium carbonate, yielding tricyclic

Synthesis of the title compound **6** as unexpectedly formed during the synthesis of pyridodiazepinediones.

OPEN ACCESS

compound **6**. After exploration and optimization of the revealed cascade reaction towards the closely related oxazoloquinolinone scaffold (Vrijdag *et al.*, 2013), we decided to turn our attention to the remarkable tricyclic product **6** isolated during the initial investigation. The ONO structural motif contained in compound **6** is brought into relation with both antibacterial (Ratcliffe *et al.*, 2015) and histamine 4 receptor antagonist (Ho *et al.*, 2013) activities. Hence, new synthetic routes towards ONOs are currently being developed in our laboratory (Vrijdag *et al.*, 2017). Here we present the molecular and crystal structure of the title compound **6**.

2. Structural commentary

Crystals of **6** belong to the orthorhombic space group *Pna*2₁ with one molecule in the asymmetric unit (Fig. 2). The

View of the asymmetric unit of the title compound **6**, showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are shown as small circles of arbitrary radii.

Table 1
Hydrogen-bond geometry (Å, °).

*Cg*3 is the centroid of the C18–C23 ring.

<i>D</i> —H··· <i>A</i>	<i>D</i> —H	H··· <i>A</i>	<i>D</i> ··· <i>A</i>	<i>D</i> —H··· <i>A</i>
C21—H21··· <i>Cg</i> 3 ⁱ	0.95	2.82	3.604 (6)	141
C11—H11··· <i>Cg</i> 3 ⁱⁱ	0.95	3.31	4.239 (6)	167

Symmetry codes: (i) $x - \frac{1}{2}, -y + \frac{5}{2}, z$; (ii) $x + \frac{1}{2}, -y + \frac{3}{2}, z$.

oxazolonaphthyridine ring is almost planar (r.m.s. deviation = 0.016 Å) with the substituents C14 [0.082 (6) Å], O15 [−0.023 (4) Å], Br16 [−0.012 (1) Å] and C17 [0.034 (5) Å] situated in the same plane (deviations from plane given in parenthesis). The dihedral angle between the mean planes through the oxazole and pyridine rings is 2.0 (2)°. The dihedral angle between the oxazolonaphthyridine ring system and the phenyl rings is 61.6 (2)°. Both H atoms of C17 are in close contact with the neighboring atoms N8 and O15 (H17A···N8 = 2.36 Å and H17B···O15 = 2.36 Å). No classical hydrogen bonds are observed.

3. Supramolecular features

The crystal packing (Fig. 3) is characterized by π – π interactions between the six-membered rings of the oxazolonaphthyridone ring systems, resulting in columns of stacked molecules along the *a* axis [Fig. 4; $Cg1 \cdots Cg1^i = 3.494$ (2) Å and $Cg2 \cdots Cg2^i = 3.906$ (3) Å; *Cg*1 and *Cg*2 are the centroids of the rings C7/N8/C9–C12 and C4/C5/N6/C7/C12/C13, respectively; symmetry code: (i) $x + \frac{1}{2}, -y + \frac{3}{2}, z$]. Molecules in

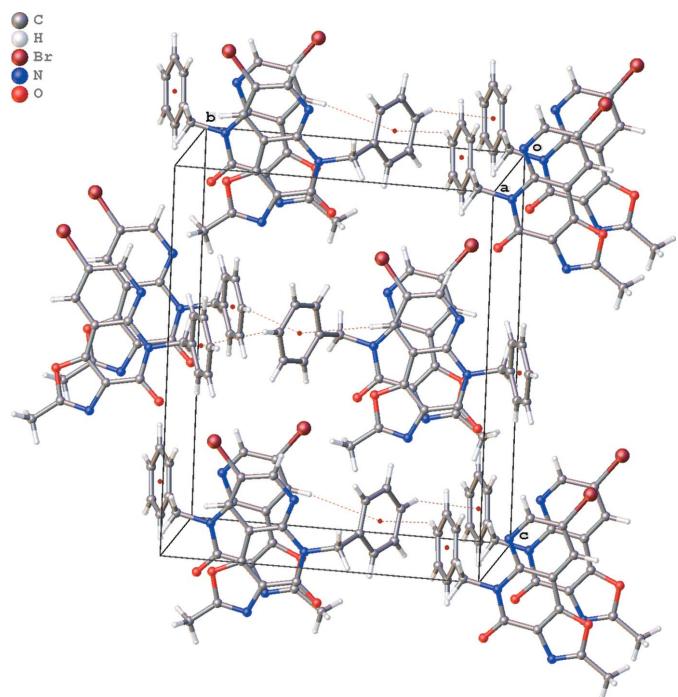

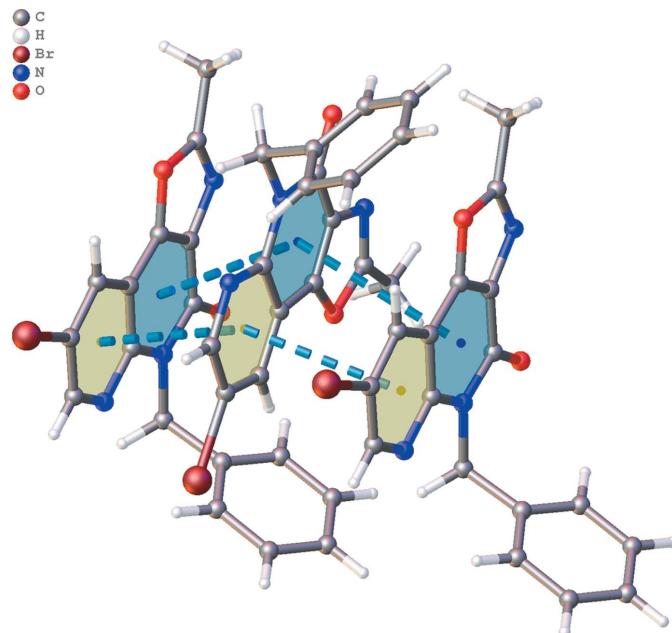

Figure 3

**Figure 4**

Part of the crystal packing of the title compound **6**, showing $\pi\cdots\pi$ interactions between the C7/N8/C9–C12 (blue) and C4/C5/N6/C7/C12/C13 (yellow) rings.

neighboring columns show further C–H $\cdots\pi$ interactions between the C18–C23 phenyl rings (Fig. 3, Table 1). The closest contact of Br16 in the packing is with atom O15ⁱⁱ [2.874 (4) Å; symmetry code: (ii) $-x + \frac{1}{2}, y - \frac{1}{2}, z - \frac{1}{2}$].

4. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.38, last update February 2017; Groom *et al.*, 2016) for a [1,3]oxazolo[4,5-*c*]-1,8-naphthyridin-4(5*H*)-one ring skeleton gave no hits. The closest ring skeleton is found in 2,5-dimethyl[1,3]oxazolo[4,5-*c*]quinolin-4(5*H*)-one (refcode HOJTUW; Latypov *et al.*, 2008), which contains a quinolinone ring system instead of a naphthyridinone ring system. The oxazoloquinoline ring is almost planar (r.m.s. deviation = 0.015 Å) with a dihedral angle between the oxazole and phenyl rings of 1.90 (13)°.

5. Synthesis and crystallization

Synthesis of 5-bromo-2-hydroxynicotinic acid (**2**), 5-bromo-2-chloronicotinic acid (**3**), and 2-(benzylamino)-5-bromo-nicotinic acid (**4**):

Substituted nicotinic acids **2–4** were synthesized following the protocols of Van den Bogaert *et al.* (2010). Analytical data matches literature data.

Synthesis of *tert*-butyl N-[2-(benzylamino)-5-bromo-pyridin-3-yl]carbonylglycinate (**5**):

2-(Benzylamino)-5-bromonicotinic acid **4** (50 mg, 0.16 mmol) was dissolved in dimethylformamide under an Ar atmosphere, and di-isopropylethylamine (27 µL, 0.16 mmol)

and benzotriazolyl tetramethyluronium fluoroborate (TBTU, 57 mg, 0.18 mmol) were subsequently added to the mixture. The reaction was stirred at room temperature for 15 m, and *t*-butyl glycinate (24 µL, 0.18 mmol) was added. The reaction was continued at room temperature for 18 h, after which the mixture was concentrated under reduced pressure. The residue was purified using silica gel chromatography (heptane/ethyl acetate, 8:2 v/v) to yield compound **5** (64 mg, yield 95%).

IR (Perkin–Elmer 1720 FTIR, KBr, cm⁻¹): ν = 1705 (s, CO ester), 1648 (s, CO amide). ¹H NMR [Bruker 400 Avance, 400 MHz, CDCl₃, δ (ppm), J (Hz)]: 8.42 (t, 1H, J = 5, CH), 8.21 (d, 1H, J = 2, CH), 7.76 (d, 1H, J = 2, CH), 7.34–7.22 (m, 5H, CH), 6.84 (t, 1H, J = 5, CH), 4.65 (d, 2H, J = 6, CH₂), 4.02 (d, 2H, J = 5, CH₂), 1.49 (s, 9H, CH₃). ¹³C NMR [Bruker 400 Avance, 101 MHz, CDCl₃, δ (ppm)]: 169.4, 167.1, 156.3, 152.6, 139.3, 137.6, 128.6, 127.6, 127.1, 110.6, 104.4, 82.9, 45.0, 42.3, 28.1.

Synthesis of 5-benzyl-8-bromo-2-methyl[1,3]oxazolo[4,5-*c*]-1,8-naphthyridin-4(5*H*)-one (**6**):

A mixture of *tert*-butyl N-[2-(benzylamino)-5-bromo-pyridin-3-yl]carbonylglycinate **5** (50 mg, 0.12 mmol) and dichloromethane (2.25 mL) was cooled to 273 K, after which trifluoroacetic acid (0.75 mL) was added. The reaction was continued at room temperature for 16 h, concentrated under reduced pressure, and dried under high vacuum. The obtained crude acid was combined with K₂CO₃ (38 mg, 0.28 mmol) and

acetic anhydride (0.5 mL) under an Ar atmosphere and the mixture was stirred at room temperature for 30 m. Subsequently the reaction was heated to reflux for 24 h, after which the mixture was concentrated under reduced pressure. The residue was purified using silica gel chromatography (dichloromethane/methanol, 99:1 v/v) to yield the title compound (12 mg, yield 27%). Light-brown prismatic crystals were grown by diffusion of pentane in a chloroform solution of the title compound.

IR (Perkin–Elmer 1720 FTIR, NaCl, cm^{-1}): $\nu = 1683$ (*s*, CO amide). ^1H NMR [Bruker 400 Avance, 400 MHz, CDCl_3 , δ (ppm), J (Hz)]: 8.65 (*d*, 1H, $J = 2$, CH), 8.27 (*d*, 1H, $J = 2$, CH), 7.48 (*dd*, 2H, $J = 7, 1$, CH), 7.26–7.21 (*m*, 3H, CH), 5.80 (*s*, 2H, CH_2), 2.71 (*s*, 3H, CH_3). ^{13}C NMR [Bruker 400 Avance, 101 MHz, CDCl_3 , δ (ppm)]: 164.6, 157.3, 150.2, 149.9, 146.6, 137.5, 131.5, 131.0, 128.9, 128.4, 127.5, 113.9, 108.5, 44.8, 14.5.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All H atoms were placed in calculated positions with C–H = 0.95 Å for aromatic, C–H = 0.98 Å for CH_3 or C–H = 0.99 Å for CH_2 H atoms, and included in the refinement in a riding model with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Hydrogen-bond geometry (Å, °)

Cg3 is the centroid of the C18—C23 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C21—H21···Cg3 ⁱ	0.95	2.82	3.604 (6)	141
C11—H11···Cg3 ⁱⁱ	0.95	3.31	4.239 (6)	167

Symmetry codes: (i) $x-1/2, -y+5/2, z$; (ii) $x+1/2, -y+3/2, z$.
