Received 6 May 2013; accepted 9 May 2013

 Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.026; wR factor = 0.073; data-to-parameter ratio = 12.5.

 In the crystal of the title compound, $\text{C}_{11}\text{H}_{12}\text{O}_5\text{S}_2$, molecules are linked by $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\text{O}$ interactions, forming a three-dimensional network.

4-(2-Hydroxyphenyl)-3,5-dithiaheptanedioic acid

K. Ravichandran, R. Manikannan, S. Muthusubramanian, P. Ramesh and M. N. Ponnuswamy

Comment

In coordination chemistry, the acylhydrazone ligands attracted the chemists due to their potential behaviour in magnetochemistry (Yu *et al.*, 2010; Guo *et al.*, 2010). The choice of *N*-acylhydrazonyl derivatives was suggested by publications indicating that compounds with such groups might have anti-tumoural activities (Rollas & Kucukguzel 2007). Against this background and to ascertain the molecular structure of title compound, the crystallographic study has been carried out.

The *ORTEP* plot of the molecule is shown in Fig. 1. The bond lengths involving the sulfur atoms in methyl sulfanyl groups [S1—C7=] 1.821 (2) Å, [S1—C10=] 1.799 (2) Å, [S2—C7=] 1.830 (2) Å and [S2—C8=] 1.794 (2) Å are comparable with the standard values of 1.82 Å reported in the literature (Allen *et al.*, 1987).

The crystal structure is stabilized by C—H \cdots O and O—H \cdots O types of intra and intermolecular interactions which form a three dimensional network shown in Fig. 2. The intermolecular O1—H1 \cdots O4 and O2—H2A \cdots O1 hydrogen bonds form two different $R_2^2(18)$ dimers. The molecules at O5 (x, y, z) and O3 ($-x + 1, -y, -z$) are linked through an intermolecular O5—H5A \cdots O3 hydrogen bond into cyclic centrosymmetric $R_2^2(20)$ dimer (Bernstein *et al.*, 1995).

Experimental

A mixture of salicylaldehyde and freshly distilled thioglycollic acid in 1:1.2 mole ratio was dissolved by heating on a water bath and let stand two days. The product was washed with water and recrystallized.

Refinement

H atoms bonded to O were isotropically refined and the other H atoms were positioned geometrically (C—H=0.93–0.98 Å) and allowed to ride on their parent atoms, with 1.2 $U_{eq}(C)$.

Computing details

Data collection: *APEX2* (Bruker, 2008); cell refinement: *SAINTE* (Bruker, 2008); data reduction: *SAINTE* (Bruker, 2008); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3* for Windows (Farrugia, 2012); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008) and *PLATON* (Spek, 2009).

Data collection

Bruker SMART APEXII CCD diffractometer	2746 measured reflections
Radiation source: fine-focus sealed tube	2180 independent reflections
Graphite monochromator	1918 reflections with $I > 2\sigma(I)$
ω and φ scans	$R_{\text{int}} = 0.008$
Absorption correction: multi-scan (SADABS; Bruker, 2008)	$\theta_{\text{max}} = 25.0^\circ$, $\theta_{\text{min}} = 2.8^\circ$
$T_{\text{min}} = 0.916$, $T_{\text{max}} = 0.929$	$h = -1 \rightarrow 8$
	$k = -9 \rightarrow 9$
	$l = -14 \rightarrow 14$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.026$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.073$	$w = 1/[\sigma^2(F_o^2) + (0.0361P)^2 + 0.2534P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
2180 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
175 parameters	$\Delta\rho_{\text{max}} = 0.24 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.21 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
